Turn on the heating, choose the level you want, I put it on it in the lower watts setting every night. 19 will show the actual temperature rooms, you need to put the storm lower than the current room temperature, once you do this wait a second with a little light coming over above the temperature reading, and you'll hear the click here heating. Then turn the time up to where you want it to put. Both of my heat turns on set to 70 but if you let it have the driver never locked up and cooked my kids all night. Once on the heat normally detects the temple room around 65%, so I turn the desired time down to 60, it clicks off and the light comes on showing it is off, then I turn it back up to 68% with the light clicks off and the teaac turns on. The dirty morning is still exactly 68. I have two, one is 4 years older then the other and they both work the same way. Please try again later. From the U.S. many prefer these and digital thermostats as I can just put them at the room temperature I want and not be adjusted to constantly being nice. But I noticed that they also tend to wear out faster. We've only had this one for two years and after about a year it would just come on and stay on. I'd have it set for 73F and it would get to 85F and still be running, so it would be way over the heat of the room. It got so that I had to turn it off at night so it wouldn't be over the heat of the room. This grille will really heat up a fast room though, so turning it on to the first thing in the morning is great. But I really want it to just control itself and don't need me to turn it on and off.otherwise I'd just use these being gold-med-high settings rather than a digital display. I'm currently shopping for a new one and certainly I hit the key in this one. Please try again later. please try again later. Paul S. Remington's Top Contributor: Brewing 4.0 out of 5 stars that's pretty bad by today's standards, but don't storm to 1974. It made little sense the whole house heat when two of us are in the family room, or, worse yet, warmly throughout the house as we sleep in the bedroom. So we purchased this Honeywell oil and it was a big decision. The heating allows you to prelegle three different heat settings. You can program to the exact room temperature you would like the unit to maintain and has a stand mode that closes the heat to off when the scheduled heat has arrived. There is also an 18-hour clock that can control how long the unit is operationally. The energy consumption for the heating is as follows: Standby: 55 Watts Low: 600 Watts Average: 900 watts High: 1500 watts For an average house with eight ceiling ceilings, the way you calculate how much watts of energy you will need to heat your room is multiplying 10W by the amount of room space. This heating isn't really designed for room over 150 sq. ft. It will work, but bigger room the longest will take in his heat and if it's too big and too cold, he won't be able to maintain a comfortable level of heat. Our family's main room is approximately 270 sq. In winter words when we get home, if we let the house enter the upper 50s, it takes a couple of hours for this heating to get the room in their upper 60s. We typically use the fire furnace to find the room up to the mid 60s, then turn the furnace off and use the Honeywell heating oil. If you have a larger room space you're trying to heat up, you may want to consider a 220V bazboard unit, which can deliver much more wattage that will translate into more heat energy. Heating oil, like this one, is a major solution for heating areas in smaller spaces, but should not be regarded as for larger areas. Now they share some experiences. We found this heating had impact in our room, again, it's a smaller space and was absolutely perfect for this room. One thing we notice is that dry heating comes out the air considerably. So we purchased a humidifier and put it at the recommended 60 level. It does two things: first, it gives moisture that is good for the sins and the breathing passages; and second, it helps to keep the heat in the air. When becoming dry, he's less able to keep heat energy. We remember how heavy the air feels in a warm and humid day. This principle holds true and the time in your room. If you maintain a healthy level of humidity, it helps in maintaining a comfortable level of heat. Normally, I would give this product a five-star rating and still feel worthy of these, but due to the fact that our corrsel device has died after a year, I have to give it a reduced rating. I've read other reviews of properties that have had problems with the thermal controls built into this unit, so just be warned that you might run into some trouble. Save your receipt and prepare you to turn it into the warranty service, if necessary. We did not save the receipt, so we purchased a new one. I'm not too angry. In the year we own it, it has paid for itself of money saved many times over. By this time, we'd definitely give it a full five stars. Hopefully you'll have better luck than we did. The first Honeywell I bought worked very well for one season. When I started having problems, I found customer service to be very responsive and responsible. OTHERS: I had a lakewood that worked very well, but Lakewood hasn't made these heating yet. I tried both different DeLonghi radiators. Both of them continue to wear out irritated fumes even after the break of period. Back Aly. Likewise for the houses I bought. He didn't put out as much heat as the Honeywell either. I gave him two days to prove himself, and then I gave up on him. As I said, the first one worked out well for a season. I did it again this fall and it worked fine for a few days. Then suddenly, the device began putting out embarrassing cheese. It smells like a CFL bulb when they go bad – very wrong. It always worked and I couldn't get any oil leaked. I think the problem was in the control panel, and expect instant heat. Rather than sending a fan-driven explosion into hot air, it transferred heat into the air, and it transferred heat into the air, a current is produced in the oil because hot oil is much more valuant. The hot oil lifted its heat, through the metal finishes, into the cold air. The oil is still increasing from below the chilly oil moves that circulate back into the heat coil to be heated again etc. Meanwhile, when the driver arises, forms its own current conversion and is circular throughout the room without any mechanical help. The use of natural conversion circulation saves money because there are no fans using more electricity. If your room cools, say, 55 degrees for a while, then do all the objects in it. In a typical room, this is a lot of mass to bring back up to the desired temperature. Until everything happens in the temple desires, all that mass is soaking up the heat from everything you use. I get these The best heaters used over a long period to heated the room with all the objects in it, then to maintain a comfortable temperature. To that end I wish the clock was set up to turn on the device (like an hour or two before I wake up or arrived home at work) rather than closing the sky at a preset time. That would make more sense to me. THEIR CONTROLS: The only other opposition to the clock is that if you accidentally turn it on by flicking the center button, your heater will be cut unlawfully in whatever number of hours you unintentionally choose. The other controls work very well and the device puts out a large, consistent heat volume for a relatively modest increase in my power bill. The thermostat for this apparently located near the floor. My floor is very cold, so the temperature recorded on the heating panel it is lower than the room time. I monitor the current room temperature and reset the heated thermostat initially. Currently it's 44 degrees outside, a comfy 72.5am inside, but the heating panel reads 68. This is of an old, drafty, poly-isolated 600 sq sq. unit with no other intentional source of heat. SUMMARY: Oil-filled heating are quiet, efficient, and safe. Cats can and do sleep right up against it without burning themselves. It won't keep the curtains fire. Noises, uneasy fans. Of all similar heating, this Honeywell is the best — well worth the additional price. It's obviously made of higher quality standards than the other, cheaper heating I've tried. It brings a three-year warranty, and the company stands behind its products. He heated the room without poisoning the air. If they made an even better one and weighed even more, I'd buy it! Please try again later. Please try again later. Michael D. Moore 2.0 out of 5 initially stars, the device would sometimes work and sometimes not, which I need to control and restart it. It now shows a constant temperature of 90 degrees F, so won't turn on whether temperature mode is activated. I'm using under time (18 hours) mode and adjusted the power level to get reasonable temperature, but I can easily see how shoppers could have the opposite problem, with it constantly heating to 90 degrees, instead of the temperature set. The warranty offered to the OEM (CheckBox) does not cover shipping either way, and adds a handling charge. Please try again later. Please try again later. I bought through Amazon and using their reviews for years. Amazon was really good to me as there are thousands of reviews I've read, this is just my way of giving a little back. Better wheels would make it roll a lot better and add that well built feel to it. Please try again later. Please try again later. Jonny 4.0 out of 5 stars I found the direction they don't write well. The auto clock and lock does work. The roof light must be for a close. The tricky part puts the auto lock into a custom temperature. I found if I set the auto clock to 73 degrees I can then lower the table until it reaches 68 degrees. The home icon bit lights up when you drop the table. I've remained this one for a long time. Auto lock the temperature must be set to 3 or four degrees lower then the current room temperature. The temperature set varies from 1-2 degrees. Please try again later. Please try again later. Amazon Customer 1.0 out of 5 stars we had the same problem as the others being described. Heating and burning out sockets of walls. I thought I put him on the medium (two bars) set but it must have changed into three bars. I didn't think this is possible until I read the other reviews. This is our second heat. The first died when it fell over. There was no way to reset it. Please try again later. Please try again later. Worked OK the first seventh. Scarce use (live in Arizona) – maybe about 2 months a year at night and early morning. Like most other reviews, now it sounds past the time set. Last week, he started travelling breaking our circuit. It even travels the break immediately after touching the button over one time – noise and spark. I suspect it was something with the unit itself.
