## Standard room sizes in a house in feet

Bathrooms are also notoriously dangerous. First, sharp objects such as razors, scissors, tweezers and nail files are used. Slipand falls are one of the main causes of accidental deaths in the United States, and bathrooms are enemy No. 1 due to the water used with the bath and sink. Another danger is the many drugs and prescription drugs that are often stored in bathrooms. This is mainly a problem with young children who tend to get almost everything they put in their mouths. Never leave medication where a child can reach it. Also be careful with vitamins; they often look like sweets and can be toxic to children. But you don't have to be a child to make a mistake. The misuse of prescription drugs is responsible for nearly 1.5 million poisonings a year in the United States [Source: Parenthood]. Just like in kitchen cases, absence also plays a role, and you can easily accidentally mix the wrong drugs and take a dangerous drug cocktail. Advertising bathroom cleaning products can also pose a risk. Bleaching agents and ammonia are on the list of ordinary detergents, and when mixed together, they can produce a deadly gas. They can also irritate the skin and eyes on your own. You may have a high-performance drain cleaner in your bathroom cabinet to unplug a stubborn sink. This cleaner is heavy-duty in every way -- some contain hydrochloric acid as an active ingredient. Others use sodium hypochlorite, commonly known as bleach, and both can burn the skin on contact. Even the air freshener you have plugged in may have phenol or formaldehyde in it. Phenol in high doses can cause convulsions, breathing problems and even death, and formaldehyde is a known carcinogen. Avoid accidents with children by storing none of these products in your bathroom, or even better -- switch to safe, natural cleaners. You may also suffer burns from the water in your shower or bathroom, as in your kitchen. Set your water heater to 120 degrees Fahrenheit (48 degrees Celsius) or below to avoid scalding. Another no-brainer is to keep all electrical products away from the bathtub. A shock by dropping a hair dryer into a bathtub is a sure way to seriously injure or kill you. Also be careful with the hair dryer around a wet sink. More dangers and how to be sure, see the next page. Just be careful not to slip! Vico Collective/Alin Images/Getty Images Most refrigerators are about 1.78 metres high and 0.91 metres wide. Depth measurements vary significantly depending on a number of factors. One of the most popular types of refrigerators to be sold from 2015 onwards is the refrigerator, which is about as deep as kitchen counters. These refrigerators are slimmer than most appliances, but any measurement of depth take into account the depth of the handles and a small 1-inch space behind the device for the necessary air circulation. For example, the Frigidaire Gallery Counter-Depth Refrigerator (model FGHC2331PF) has a depth of 31 inches, including The Handles. The size of the refrigerator needed for a house or business depends on how many residents or employees use it. Smaller refrigerators are not always much more energy efficient than larger ones. Smaller kitchens can look overwhelmed when refrigerators are very large. The actual cold room can vary if you cool side by side and compare refrigerators with freezers at the top or bottom. Curtains and curtain panels come in standard lengths of 63 inches, 84 inches, 95 inches, 108 inches and 120 inches. Animal curtains, also known as café curtains or kitchen steps, are available in 24-inch and 36-inch lengths. The width of the panels varies depending on the style and manufacturer, but 54 inches is a standard width. Window treatment measurements are specified in width and length, with the width mentioned first. The length is measured from the top of the bar pocket to the bottom of the plate. When the panel is hung, it usually only reaches the floor or window sill. To determine the number of panels required for a window, the width of the window is multiplied by 1.5, 2, 2.5, or 3, depending on the desired amount of fill. candyjbarrow/Moment/Getty Images Windows are manufactured and sold in various sizes. A few measurements for windows on the market are: 33.75 inches x 53.75 inches, 27.75 inches x 45.75 inches and 31.75 inches by 49.75 inches. They also come in a variety of shapes and styles. In order to improve the cost of housing efficiency, information about the house and the local climate is properly researched and implemented for greater benefit. Double window windows help to keep the air inside the house at an ideal temperature. Tax credits for eligible home improvements that contribute to energy efficiency. Homeowners also save money by replacing windows themselves. Yourself.
