3 car garage plans with office

Troubleshooting Common Winter Garage Door Problems Buying and Installing Garage Exhaust Fan How to Build a Garage Door Gazebo or Pergola 3 Ways, how to upgrade the garage in the weekend Carport Cover Replacement: 3 tips Garry Steck • Garage doors Torzia Spring Repair Methods garage doors Spring repair How to strengthen the garage door Beth Dawson • Epoxy garage floor covering Luke Arthur • How do you ensure you have enough space to work and play in your home office? Turn into a two-car garage for this purpose. Lifehacker reader SlowAndEasy has been tinkering with his garage-to-office conversions for some time. Thanks to some quiet time around the festive weekend, he had the opportunity to clean up and get everything just like that. What does it mean? Read his description of the project to get an idea of what goodies you'll find in his tastefully appointed garage: It was originally a double garage built into my house. I fitted it with a few inches of sound insulation, installed air-con units for heating and cooling then painted it white to emphasize light. Mounting them from scratch allowed me to get the wiring all hidden away. I got a CAT5 everywhere, a speaker cable in the ceiling and coaxing for different purposes all connected to the patch panel. The room serves several purposes, I work from home, so it's my office, I love movies, so it's my home theater room, I'm passionate about photography, so it's my photo studio and I like to build/hack stuff, so it's my lab. Much of the device has been rescued and repaired, such as an HD projector and a 24U rack box. 27a 26 dual head display is the only real extravagance, I'm a fool on the big screens :)Total swan home office, if we say it ourselves. If you want to take a closer look at its well-stitched panorama, check out the original image at the link below. If you have your own preconceid workspace, throw the images on your Flickr account and add it to the Lifehacker Workspace Show and Tell Pool. Please provide some details about the setting and why it works for you, and you only need to see it featured on the front page of Lifehacker. G/O Media can get a commissionCubii For Under-Desk Elliptical Garage Office [Lifehacker Workspace Show and Tell Pool] Picture: PeopleImages/E+Getty Images The average car consists of over 30,000 parts, and with this level of complexity, it's challenging to keep everything running in harmony. You - or the mechanic - will have to work on it from time to time to keep the system going. But how much of it are you willing - and able to - do yourself? How long can you keep your vehicle out of Service Bay 3 and in your own driveway? Here's a quiz to separate self-sufficient drivers from customers. One of the keys to keeping your car in your own garage and out of mechanics is preventive maintenance. It takes some effort and a little money at that moment, but those who know how to care for their car child properly will save themselves considerable time, money, energy, inconvenience and sadness by doing a little work now to avoid a lot of suffering later on. Another key skill is understanding what your vehicle says before you travel together. Which sounds are normal road sounds, and which ones are more serious? Each vehicle has its own jokes, but some brands should never be ignored. Can you tell each other? So, what type of driver are you? Do you stick your head in the sand and your path roughly interrupted by flashing lights on the dashboard, grinding sounds from wheels and steam soaring under the hood? Or are you the kind of owner who isn't afraid to go to your favorite auto delivery store, get your hands dirty and pride yourself on a finely tuned car that lives its best life? This quiz will reveal everything! Collect your tools, sync your maintenance plan, and have this show and car on the go! The redness of the radiator – washing out all the liquid and replacing it with fresh coolant – will receive all dirt, rust and other potentially harmful impurities from the cooling system and keep it in the highest working order. The rule of thumb is to change it every five years or every 100,000, which is the first place. However, when setting up your own schedule, read the guide and keep your specific driving habits in mind. The air provided to the engine for the combustion process is first locked through the air filter, keeping it clean of dirt and dirt and burning better. Maintaining the filter cleanliness can also extend the life of the engine. If you drive in dusty conditions, you may need to change the filter more often, but for most vehicles it's easy to work diy. Read more If you often work on your own car, you know how difficult it can be to sneak under it, replace a component or check fuel or brake lines. It's hard to see what you're doing and it can be challenging to get any job due to lack of space. To make it a little easier, you should consider installing an elevator in your home garage. This allows you to raise and securely hold your vehicle, which makes it so mu-ch easier to work under it. While this sounds like a big investment, some are not as expensive as you'd think. Check out our shopping guide below for some of the best car lifts available. Best Auto Lift for Home Garages We kick off our list with this product from TRIUMPH which has some really good features. You could even say it's a triumph of engineering. Lame jokes aside, there are a number of stand-out features on this product, but the boss among them must be the price. It's phenomenal value for money. It's also excellent quality. The weight capacity of 9,000 pounds is well toward the top range for a two-post car lift. It provides spare capacity to increase most family vehicles. Swing arms are very well designed and allow quick and easy connection to the bottom of the car. It will be accessed with extensions so they can also be used on trucks. The connected engine has the power to lift the vehicle in seconds so you don't have to hang around and wait until you get to work. QuickJack by name and QuickJack by nature. This product may not have lifted the capacity of a two or four-post car elevator, but it brings a number of other impressive features to the table instead. One of them, as our witty opening line suggests, is speed. This lift can get the vehicle into the air in minutes, thanks largely to its powerful 110V AC engine. Just lay two cantilevered lifting platforms on the floor, and drive your vehicle over the top. Turn on the engine and retreat as the welded steel reinforced frame box takes the voltage and lifts your vehicle up to two feet into the air. It stays awake due to two-position security locks that automatically during the lifting process. This from Bendpak is another portable-style car lift with decent lifting capacity. It weighs up to 6,000 pounds, which isn't too ragged for a device that measures 81-inches long 40-inches wide. This lift also has electricity supplied to the engine. That engine is a single-stage, 220-volt model that packs a total kick. The lifting platform can increase from floor height to maximum lift height in about 45 seconds. This second entry from TRIUMPH is the first example of a four-post car elevator. As you'd expect, this style lift has extra lifting capacity, which in this case is £8,000. This is one of the key features of this car lift, which provides the power to lift just about any type of passenger car. In addition, the product has 10 different locking positions through the arc of motion. This is a useful feature because you can raise and hold the vehicle to the height that you will find most useful. It is also one of the simpler styles of four-post car lifts with easy to set up and maintain – but still highly efficient – basic hydraulic system with a simple electric motor. This two-post car jack from the APlusLift features a skipping 10,000-pound capacity with a strong double-S column design and CE-certified elevator structure and hydraulic system. The lift has a symmetrical and asymmetrical arm assembly and several safety features, including automatic arm locking systems and a built-in electric pump relief valve to prevent overload. Lift is a heavy choice made of durable, robot-welded steel coated with powder coating. It takes 50 seconds to fully increase the vehicle, which you can lift at the touch of a button up. The unit has a maximum lift height of between 75 and 81 inches, depending on whether you are using a product truck adapter, while the drive-through clearance is 100 inches. This is the second four-post style car lift on our list. This is a high-quality car lift that is completely full of features. It does, however, also pack a high price. It weighs 8,000 pounds, so it can handle a wide range of vehicles. Its hydraulic system uses aircraft quality cabling, which is an emergency safety feature that means you can use this lift with little concern. It also includes 18-inch wide runways that make it easier for the vehicle to ride on an elevator and provide additional safety. The ultimate stand-out safety feature is the safety system of the lock ladder, which nod to the operation in the unlikely event of a failure of cabling or hydraulics. We are completing our list with another high quality lift from BendPak. This is a premium product that boasts a huge range of features but also a higher price tag than you will find on simpler car lifts. The first thing to note is the weight capacity is 10,000 pounds. This is pretty much the maximum you'll find on a two-post Elevator. If you have a heavier vehicle but would like a two-post lift system, this could be a model for you. It actually has a higher capacity than many four-post models, which is not something you see very often. In our buying guide, we will guide you through the features that you should keep an eye on when choosing the best car lift for you. Then we'll look at how best to use your new tool and answer some of the most frequently asked questions about this very useful product. That to consider when buying a car lift for a home garage One of the biggest considerations with these types of equipment must be space. Or more accurately the space that you need to use in your home garage or store. 4 post car lift will need a hell of a lot of space, while a 2 post car lift can get away with a little narrower work surface. If there is room for real premium, or if you would like to work outdoors on disk, a portable car elevator or scissors style model may be the best choice for you. And more importantly how much does your car weigh? We mention this below in the safety tip section, but it's worth pointing out here – don't pick up a car that weighs more than the weight of the elevator capacity. Dot, dot, no excuses. It's also a good security idea to build in artificial capacity. So if your car weighs around 6,000 pounds, look for an elevator that can handle at least 8,000 pounds, so you have a little extra capacity. Permanent or temporary installation Do you want to move the elevator to the car to different locations? If you would it would be good to invest in a portable elevator such as a scissors lift. Are you happy that the elevator stays in one place after installation? This opens up the possibility to pick up 2 or even 4 post design. Both are very heavy and are usually screwed down, which means they have very little (if any) portability. Types of Car Lift There are three styles of car lift, and you'll see examples of them all in our list of products above. Each one comes with pros and cons to their respective designs, and they are: This style represents the simplest style of car lift. Also known as a portable car lift, it is easy to operate and install – in fact sometimes it doesn't need any installation at all! The downside, however, is that it is a little underpowered compared to the two styles below, which for lower upper weight capacity. Yet they can be a great choice if you need to temporarily increase your vehicle only here and there – repair a damaged wheel or tire for example. They are also almost always the cheapest choice. These elevator styles represent the middle way between the scissors and the 4 post style car elevator. To do this, they will have a higher capacity than a scissors lift, and will also lift the vehicle higher into the air. On the other hand, using 2 post These kinds of car elevators certainly take up a heck of a lot less space compared to the 4 post model, which is perfect for use in smaller garage houses and shops. Finally we have a good old 4 post. They are the largest and usually the strongest of the elevator options. They are also very heavy (often over £2,000) and will be bolted to the floor. That means they have no portability at all. On the other hand, if you need to get your vehicle up in the air quickly and efficiently – and keep it there as well – these types of lifts often represent the best way to do so. How to use the car elevator It will vary depending on the style of the elevator that you have chosen. This means that the most important thing of course is to get the vehicle loaded safely onto the elevator. Scissors and a 2 post car lift will see the frame of the vehicle resting on the supports. Always check the vehicle manual for the safest and strongest parts of the frame for attaching supports. If you've invested in a 4 post car lift with floorboards, then it's a much easier operation to get the vehicle to lift. Simply go to the floorboards, apply the handbrake to secure the vehicle and... Well, that's actually about it! Once the car is safely safe on the elevator, simply lift it into the air. This really highlights the simplicity of these devices, certainly one of their stand out features. Related posts: The best Topside Creepers and the best Car Creepers Car Lift safety tips, as we mentioned, always make sure the car is safely on the elevator before operation. Refer to the lift operating instructions to ensure a secure attachment. Always place the lift on a solid stable and strong floor area. This will allow the car lift to function safely without any risk of slipping or collapsing on an unsuitable base. Follow the installation instructions carefully! They will vary between lifts, making it difficult to provide firm advice on installing on a particular elevator here. All we can point out is that all the information you need for a safe installation will be supplied in the paperwork product. The ultimate safety spike, and this is important - never lift a vehicle that weighs more than the upper weight limit. In fact, you should not regularly lift anything that is approaching the upper limit. If your car weighs 6,000 pounds, you should look for a lift with a rating of at least 8,000 pounds to provide enough spare capacity. Best car elevator for home garage FAQ: Question: What is a clearfloor car elevator? : A clear style of floor lift will employ weapons to increase the vehicle. You'll mostly see the 2 post style elevator. The advantage is that they leave most of the bottom of the car free of charge, allowing you more access when working on the vehicle. It also means that the wheels hang for free, making it easier for them to work on too. The second style of the elevator will employ floorboards. They are simple metal on which the vehicle is driven before lifting in the air. This makes them very easy to use and also very safe – although they cut down on the ability to access the bottom of the car, and the wheels, for easy maintenance. Q: How do car elevators work? A: Very simply work to lift the car into the air, usually using hydraulics. There are of course a variety of different styles, shapes and designs of the car elevator. But they use an electric motor to power the hydraulics to lift and hold the vehicle in the air. Q: What is a car elevator used for? A: Lifts from the post car will usually – but not always – be installed in one place with very little portability. This makes them ideal for installation in a home garage or shop where you work on vehicles. They are like buying a good tool bench, providing useful services in the store or garage. Due to their long-term style of installation, they can also provide an excellent solution for storing vehicles. If, for example, you have a summer car as a soft top (lucky you!), then you can pop it on to a 4 post car lift, lift it in the air and store it there to free up floor space. Q: How much does it cost to install an elevator? A: Actually very little. Yes, they look like complex machines, but don't be fooled. The main problem is really weight, with the largest car lifts weighing more than 2,000 pounds. To do this, you will need to hire a good pump truck or similar device to help move the pieces into place. A professional electrician will need to connect the lift to the appropriate breakers for safe operation. We would also strongly recommend that you bring a few buddies to help with the installation. We can't guess what it would cost in terms of reeling though. Our Top Pick While our list includes a number of excellent products, we recommend the Triumph NT-9 2 post car lift. It features everything you need in a two-post design, including a lifting capacity of £9,000. It is also easy to attach the vehicle to the elevator arms, and it is easy to operate. This lift it all at a decent price, which is why it earns our top pick designation. It's a real triumph of engineering. Oh, right- we've already made that joke.
