## Itech smart watch user manual

Often filled with jargon, acronyms and directions that require a PhD to understand, software users' manuals are sometimes written from the perspective of a developer rather than a user. Therefore, the guide can make assumptions about the skill level of the reader that are often incorrect. The first step in writing a good user manual is to get the actual writing process as far away as possible from the engineers. The software developer knows more than anyone what makes the software work, but that doesn't mean the developer has to write the guide. On the contrary, it is a distinct disadvantage. More important than a thorough understanding of the inner workings of the software is an understanding of who will be the end user, what his level of education is, and how that end user will be using the software. In most cases, end-users don't need to know the finer points of programming and back-end software operation - they just need to know how to use it to make their job easier. The user manual should be largely task-oriented, rather than highly descriptive. Since the manual is written to help users understand how to perform specific tasks, the author must have an understanding of these tasks as well, and therefore, going through every discrete step of each feature is absolutely essential. It is not necessary for the author to necessarily know how the program was created from a design or development point of view, but it is essential to have a solid working knowledge of all its features. When performing each task, take the time to write down each step, including clicks, dropout menus and other actions. Although the developer should not be the one to write the manual, it will still be a valuable resource for the writer, and before writing begins, schedule a launch meeting between the writer, developer and engineers, and potential end users to help inform the writer's work from the beginning. Interviews with subject matter experts and engineers should be recorded, and transcripts should be made for further reference. A user manual should not be too heavy in text. Instead, incorporate the liberal use of graphics and screen clips. The description of an action is much clearer with text-based directions accompanied by a screen clip that clearly illustrates this direction. Include the before and after views, to show what the screen looks like before taking each action, and what happens after that was taken. A simple screen capture utility such as the snipping tool included in Microsoft Windows works well to capture these images. Be sure to number each image and include a caption that describes it briefly. Center it immediately below the paragraph that first introduces the concept depicted in the image. Communicating clearly in a technical document requires careful planning and adherence to standards throughout the guide. Standards in both language, and nomenclature help avoid confusion. The models are available and can be a good starting point for uniformity, although they can certainly be adapted to each situation. Using a one-inch margin with a single column is best suited to the need to add graphs; A two-column setting may seem too cluttered, and can make the placement of images confusing. More than any other type of document, a software user guide is likely to go through several iterations before it is completed, and it is likely to go through a multi-stakeholder review process. Using Track Changes on Microsoft Word is an easy way to track each individual's comments and changes. Creating multiple versions after each review cycle, each with a different file name, also helps the process and ensures that all stakeholders are satisfied with the final result. Smart watches are all about making your life easier. No more rummaging through your bag for your phone. Stay connected to this wearable technology at a glance that's all the rage. Follow our guide to learn more! COMMENCERThe smartwatch market is growing fast, with new devices and styles hitting stores all the time, offering a wider choice of what it needs to wear on your wrist to stay in touch. Whether you're someone who likes to keep on top of your social media feeds or check who calls before taking the phone, a smartwatch is a bit of a portable kit fantasy that has a range of features, apps and games to keep early adopter technicians satisfied. Before you start shopping, however, you need to know which smart watches work with which phone brands. Your smartwatch needs to talk to your phone, so your options will be reduced when you start looking at what's available with the same compatible operating system (OS). There are models that can run on their own without a smartphone, accessing the Internet via a built-in antenna, but they are far and little in between and you still need a corresponding phone device to set them up in the first place. A new smartwatch will take a little time to get used to. Talking in your wrist, for example, while walking down the street can raise odd eyebrows, but the thrill of using the latest technology is hard to beat. You also need to consider what you want from your smartwatch. This market is growing all the time and all smart watches not the same functionality. Think about what's important to you. Some models excel in battery life, while others are distinguished by their ease of use. If the look of the smartwatch is important - and frankly, why wouldn't it? There are some fabulous designs available with serious bling appeal, some offering interchangeable straps and colorful backgrounds. And for fans of the classic James Bond timepiece in GoldenEye, which came filled with a laser beam and remote control for detonation you won't be disappointed. Ok, your neighbors can rest easily at night, but most come with enough gadgets and technical magic to satisfy a modern M. And if you can't have Daniel Craig, a smartwatch is the next best thing! OPTIONSOperating systemsSmartwatches have taken off in a significant way and there are new models to launch smartwatches every month. Technology is also evolving at a rapid pace. When they were launched, there were three operating systems to choose from, and you on your side, you agree with your smartphone. Options were more limited for iPhone users, compared to Android, for matching devices. But Android Wear is now iOS compatible, although this change comes with a few caveats (see below). Watch OSApple uses its own Watch OS operating system for the Apple Watch. If you want one of these smartwatches, you'll need an iPhone mobile device to work with it. Like the iPhone, it seems that Apple will introduce upgrades frequently, with the recently released Apple Watch OS 2, followed quickly with an update for the operating system, 2.0.1. Styles vary, but the features, processor and components are the same on all models. You can make phone calls, dictate texts, use Apple Pay, check your synced calendar and talk to 'Siri' the virtual assistant to make a call for you! Prices vary depending on the type of material the watch is made in, with the gold cuff version starting at 8,000 euros! Android WearGoogle Android Wear operating system works with a number of different smartwatch manufacturers and most of the smartwatches available will be compatible with Android Wear, so you can be more selective in the watch style you buy, and should find one to suit most budgets. Each phone will come with its own range of features though, which should help refine your choice. Android Wear for iOSAndroid Wear for iOS is now available, making it compatible with the iPhone. So these watches open up to a lot more choices here. However, you will need to have an iPhone that works iOS 8.2 or more and not all Android Wear smartwatches are compatible - only the new models work with an iPhone. You may also find that android Wear features available on your iPhone are limited compared to those of an Android device. For example, you can receive notifications from third-party apps, such as Twitter and Facebook, but you can find when it comes to responding to messages or emails. This is not to say that the functionality will increase over time. Smartwatch technology is developing, with improvements changing day by day. Pebble OSThe Pebble OS works with pebble smartwatches and the operating system works with both Apple and Android smartphones. Unlike other devices on the market, the Pebble uses the e-paper screen - much like an e-book reader - and has no touch screen. In Features you use side buttons, much like using a traditional digital watch. Tizen OSSamsung operating system works with Samsung smartphones, although the latest Samsung laptops on the market are compatible with most Android phones and may soon be compatible with the iPhone. THINGS TO CONSIDERTouchscreenYou can use your smartwatch to open apps, type text messages, etc. in the same way you would your smartphone, with a touch screen. However, the Pebble range of smartwatches uses side buttons to control functions. Deep voice actions to dictation emails and text messages. As the screens are quite small, it is a useful feature that you will use more and more as you live to talk in your wrist. TrackerA of activity built into pedometer to use your smartwatch to track your daily fitness and get detailed measurements during specific workouts. Some smartwatches also have a built-in heart rate and pulse monitor and sleep tracker, much like a regular activity tracker. Remote Control allows you to use your smartwatch as a remote control to control music playback or the camera on your smartphone. Bluetooth enabledTo connect your smartwatch to the Internet so you can access features and phone signal to check your texts, you'll need to attach it to your smartphone via a Bluetooth connection. Wi-Fi Connection Without attaching your smartwatch to connect to open Wi-Fi networks without the need to connect to your mobile or iPhone first. Built-in GpsSaves will keep you on your phone while you follow the instructions on a map. Smart appsAth follow the latest news, weather and loads more from elsewhere. Watch FacesDownload a variety of faces from watches from analog to digital styles to customize your watch to match your outfit! Stripe resistancePremium models are available with their own brand of highly scratch-resistant glass cover. Battery lifeThe duration while you can use your watch before it needs to be recharged. If it's important to you, shop around. The latest models coming on the market boast a battery life of up to 10 days, but some rates hurt in this area. Some models can be charged wirelessly. Water and dust resistantWhile a smartwatch will not be fully waterproof, most will have a water and dust resistance rating to assess in which they withstand a downpour. Dust is harder to quantify. Can a device be submerged by cat hair for example! You should check an IP rate of the devices, which represents the international protection rating. Each model will come with two numbers after it, the first for dust and the second for water, so you could see IP67, meaning it is fully protected from dust (6) and can also withstand being immersed in 1m of static water for up to 30 minutes (7) - see table below. Technology is evolving rapidly on these new watches and it won't be long before you find most smart watches are waterproof, but in the meantime common sense should prevail!
