Garmin dash cam 10 20 manual pdf

Garmin's latest product is a GPS package, but it's not a Nuvi or navigator. It's a Garmin Dash Cam 20, seemingly oddly suited to the navigation giant, but not at all a bad first step in that direction. It's a camera... Dash Cam 20 is a dash cam or DVR dashboard. The cam hangs from the windshield of the vehicle with part of the lever-activated suction bracket that connects to its body through the ball-in-socket joint. The camera body itself is about 6.6 cm square (not counting the connection to the mount) about 3.7 cm thick and quite inconspicuous when hanging above the dashboard. Pointing to the way forward is a small, fixed-focus HD camcorder that is capable of capturing 1080p, 720p or WVGA video with an extremely wide field of view. Think of the GoPro footage and you'll have an idea of how wide an angle we're looking at. Mounted above the center of the dashboard of the vehicle I tested it, the camera captured the entire view from the windshield. Dash Cam 20 automatically captures video of incidents up to 1080p. Antuan Goodwin/CNET Face to Face Controller's 2.3-inch color LCD display that shows a preview of what the camera sees to assist in framing. Here's also where the driver interacts with different settings, menu options, and media playback controls via a bank of four physical buttons just below the screen. As soon as the vehicle gets moving, the screen dims and then turns off after a while to avoid distraction of the driver; the only recording indicator is a small flashing red light. On one edge of the device is a mini-USB port to connect the included 12-volt power adapter. When Dash Cam captures power, recording starts automatically. When the power is interrupted (e.g. when the vehicle's ignition is switched off), the camera switches off automatically after about 15 seconds. The Dash Cam can be used without 12-volt power supply - there's an internal rechargeable battery and has a power button on one side for manual start and shutdown - but for advanced recording, an adapter is recommended. Located just below the power button is a small slot for included 4GB microSD card storage. If you need more space for clips, Dash Cam can accept cards up to 32 GB. View all photos +7 More It's always recording ... Dash Cam records a continuous loop of action happening outside the windshield (or wherever you choose to attach), rewriting old footage as it loops around with new images. The camera can capture up to 1080p video and audio, but the owner can set it to record at a lower resolution or without sound to save space. The on-board camera is internally equipped with a G sensor that detects shocks and impacts. When the sensor is running, the camera loudly captures and captures and protects the video clip leading to the impact and a few seconds after footage of a possible accident is saved from Across bumpy roads, this can lead to more false alarms. I filled my 4GB card only after a few hours of spirited driving, but on smoother roads you probably won't have as many fake triggers as I did. Fortunately, the driver has the power to adjust the G-sensor sensitivity. The video is captured in AVI format, which will require Mac users to download third-party playback software. The video quality is crisp and generally clear enough that you can make the number plate numbers of passing cars. As with most ultra-wide-angle cameras, you'll need to be pretty close to a lead car to capture the number plate in detail. Also, like most outdoor action cameras with simple optics, dash cam had problems with scenes with high range exposures and I saw the sky blown out and shadows lacking detail. The video isn't pretty, but it gets the job done. Page 2 of the Dash Cam 20 is equipped with an internal GPS receiver that captures and overlaps latitude, longitude, speed, direction of travel, date and time at the bottom edge of the recorded video. Unlike some GPS-put cameras, the Dash Cam 20 does not include software that would later match and override some street map data with video to make it easy to understand. Given Garmin's access to excellent mapping software, it's disappointing. The video quality is good and detailed, but the high-contrast image isn't exactly pleasant. The Antuan Goodwin/CNET Dash Cam 10 model is available that lacks 20 is a GPS receiver but is otherwise identical in hardware and operation. Finally, the Dash Cam can be removed from the suction cup holder and pocket to capture photos (1,920x1,080 pixel resolution, JPEG format) that can be useful for surveying damage to your vehicle or barking shots from the area around a car accident. It's simple, really... I had remarkably few complaints during my testing of the Garmin Dash Cam 20 - even less after a quick dip in the Settings menu. My main disappointment was the lack of software for some map overlay that would make better sense of captured GPS data, and the decision to use the AVI format instead of the more common and versatile MP4. However, after I tweaked the sensitivity to reduce false alarms, disabled the loud beeping that accompanied each automated capture, and the disabled secondary beeping that accompanied each button press, dash cam 20 hardware worked unobtrusively. This is a sort of point with the DVR dashboard: You don't want to attract your eyes and ears while you drive. I liked that the camera contains a small screen for placement. I'm not the kind of owner who would leave this thing stuck to the windshield in an automatic car, so I ended up removing and replacing it quite a bit. That said, I also like to have the screen automatically shut down as soon as I hit the road. Dash Cam 20 is about plug-and-play as they come. Once you connect the Dash Cam, it starts recording and you don't have to think about it for it until you fill your memory or find yourself in an accident. The bits of interaction that I had (preview videos and photos on LCD and set menu options) were simple and intuitive. The Dash Cam 20 is good, but considerably more expensive than the generic models you'll find on the web. The Antuan Goodwin/CNET Dash Cam 20 will run you \$249.99 if you're interested. In a world where Amazon.com is jam-packed with no-brand cameras for less than \$100, that's a steep price to pay, but you're getting a good product for money with an embedded GPS receiver. The above Dash Cam 10 is \$219.99, but it's far from saving enough to justify the lack of GPS.
