Largest shoe size in world

While long, height, wingspan and empty weight are all valid criteria in aircraft rankings, the most commonly used to determine which field is the largest is the maximum takeoff weight (MTOW). That's what most planes can weigh and still get off the ground; it combines not only the weight of the aircraft but also the supply of fuel and cargo (human or otherwise). By using MTOW criteria, it is not difficult to choose a winner. That's an Antonov An-225. The An-225 commercial is a cargo jet. It transports vehicles, supplies and all sorts of aid around the world. But it started his life serving a different purpose. Built to transport around Buran, a Russian space shuttle. When the Russian space program was halted in the early 90s, the An-225 found itself idle and went into storage. Years later, one of the two existing An-225s discovered a new role as a commercial cargo jet (the second remains in storage to this day). It is ideally suited for the role due to its size and maximum takeoff weight. It can hold 46,000 cubic feet (1,300 cubic meters) of cargo. That's enough for five military tanks or eight second-rate buses [source: BC]. More importantly, with a maximum takeoff weight of 1.32 million pounds (600,000 kilograms), it could get the tank or bus out of the ground -- and fly it nearly 3,000 miles (4,800 kilometers) to their destination [source: Aerospace, Eisenstein]. By comparison, the Boeing 747 and An-124 (models based on the An-225) have a maximum takeoff weight of 900,000 pounds (405,000 kilograms) [source: Aerospace]. The A380 could get down to the ground carrying around 1.24 million pounds (560,000 kilograms), which is a pretty close second and beats other passenger planes [source: GA]. The huge Spruce Goose has an MTOW of 400,000 pounds (181,000 kilograms), which is still a record for a seaplane [source: Aerospace]. While the An-225 topped all aircraft, and the A380 outperformed every other passenger plane, the future of aircraft design could make it a little easier. The lighter composite material allows for more weightless sizes, and advances in flight technology and flight design make it easier to gain more weight off the ground. With the A380 in service in 2007, we can no doubt expect to see an increasingly massive airline in development in the coming years [source: FG]. For more information about the aircraft and the An-225, including full specifications, see the link on the next page. Keep up with the latest daily buzz with the BuzzFeed Daily newsletter! Ints Vikmanis/ShutterstockTwo thousands of years ago, there were only 170 million people living on Earth. Mankind is on the trajectory since then — it came in at 7.7 billion people in 2019 and is projected to reach 10 billion in the 22nd century. What is the most The cities of the world used to look equally surprising. Our growing population presents many challenges, according to the UN, especially as countries look to achieve sustainability goals by 2030. Basically, the more people on Earth, the more resources like food, water, and soil we need, the more resources we take from other species, and the more waste we produce. There's good news. Population growth is slowing and in some countries, and elsewhere, some populations are shrinking. However, there are other places that almost burst at the seams. We're looking at the 20 most populous metropolitan areas on the planet. mandritoiu/ShutterstockCurrent population: 13.458,075 peopleAlmost 5,400 people per square kilometer packed into this urban area on the Brazilian coast. It is one of the most popular tourist destinations in South America, yet more than 20 percent of its residents live in poor conditions in nearly 800 favelas, or so-called sub standar districts around the city. On the plus side, however, population growth is slowing. In 2019, Rio de Janeiro was the 19th most populous city in the world. thatreec/shutterstockCurrent population: 13.589,078 people The population of this 12,000 square kilometer port city in Northeast China was expanded by a whopping 188 percent between 1953 and 1982. Fortunately, growth has slowed since then — it expanded just 1.4 percent between 2019 and 2020 — but shows no sign of leveling off or even declining. Manufacturing is the largest industry in the city and contributes to its rapid and consistent growth. Surprisingly, China is also home to one of the cities you learned in schools that no longer exist. Al.geba/shutterstockCurrent population: 13.923,452 people Growth in Manila's urban population has actually slowed over the years as the surrounding suburbs have seen an increase in population, that doesn't mean the city is getting less crowded. In fact, Manila is the most populous city in the world with 111,002 people per square mile. Plus, with many impoverished migrants moving to Manila from rural areas, Manila's projected increase in growth rate is sure to put further strain on resources. It's strange to think that there are major cities in the world with millions of inhabitants, like Manila, but there are also small countries that you never knew existed. Willie Schumann/EyeEm/Getty Images Safe population: 14,342,439 PeopleKinshasa did not make the top 20 list in 2019, but quickly jumped to 17th place. The capital is growing fast, with growth of 4.3 percent between 2019 and 2020. The number of 14.3 million is even more remarkable when you consider that in 1950, the population of the city was only 201,905 people. The population of Kinshasa may seem great, but nothing compared to worldwide population. ariyo olasunkanmi/Shutterstock Population: 14,368,332 People This port city—and Africa's largest city—comes from the protected islands of Lagos Lagoon, but has since expanded about 50 kilometers inland and now covers about 452 square kilometers. Its diverse population is represented by about 250 groups, many of whom have emigrated both from rural Nigeria and from surrounding countries. Most of the population—66 percent—live in slum conditions. Economic differences between countries around the world also mean that a dollar will make you get 50 different things around the world. Radiokafka/shutterstockCurrent population: 14,850,066 Indians (1.3 billion) and China (1.4 billion) are two of the most populous countries in the world, so it should come as no surprise that Indian and Chinese cities rank as some of the most crowded. Kolkata, a.k.a. Calcutta, the Company's former East India trading post, as well as the headquarters of Mother Teresa's Missionaries of Charity, is India's third most populated metropolitan area — a slowing trend but, thanks to the rising popularity of its suburbs, shows no sign of reversing any time soon. No matter what size your city is, we should all emulate the best city in America. SC Image/shutterstock Safe population: 15,153,729 peopleMemutanya Argentina's capital has only 3 million people living within its urban core, its wider territory, 2,681 square kilometers is home to the second largest population in South America. Although the suburbs of larger metropolitan areas have grown over the past 70 years, the city centre remains fairly constant, size-wise; its stagnant economy has meant that people are more vulnerable to moving out of the city than into it. The best cities that people emigrate in usually have a strong economy, but the people who live there really define a city. Buenos Aires is also one of the 50 most beautiful cities in the world, travel experts say. EvrenKalinbacak/shutterstock Denser population: 15,190,336 Istanbul people, formerly Constantinople, ranked as the most populous city in all of Europe, although technically, half of these are located in Asia. The city's population doubled in the 1980s when its border parameters were widespread. It boasts the world's largest airport — a lucky coincidence for one of the fastest growing metropolises. asiastock/shutterstockCurrent population: 15,872,179 peopleLike many other cities in Asia, Chongqing has seen a huge population surge — a huge 3.3 percent since 2019. In fact, Chongqing is one of the fastest growing cities in the world as the World Population Review shows, that won't change anytime soon. The city has other problems besides its rapid expansion: Its workforce is shrinking population age—a strange and calming fact to consider along with the total population of chongqing municipality, which currently reaches a staggering 33 million people. Instead, it is the smallest city in America by population. Asianet-Pakistan population/shutterstockCurrent: 16.093,786 peopleOne-fifth of Pakistan's urban population is in the megacity of Pakistan's capital, according to a World Bank report. While its population has soared—up 2.2 percent since 2019—its quality of life has plummeted, with violent crime, inequality, and financial instability all contributing to developmental challenges. Karachi is also one of the most populous cities in the world; has 24,000 people living per square kilometer. If a crowd this big makes you uncomfortable, check out the best places to move in the U.S. before they get too crowded. beeboys/shutterstockCurrent population: 19,165,340 peopleNumber of people living in Japan's food-centered metropolitan area and third largest actually declined—down 0.3 percent since 2019. But nearly 20,000 people squeezed into the wider Kansai region (which includes the city of Osaka) along 27,000 kilometers making for some tight shelter. And in fact, 7 percent of Japan's total population lives in smaller spaces in the region, in the city of Osaka proper and 42 municipalities. Population Of Boris-B/shutterstockCurrent: 20,411,274 people The second largest metropolitan area in Him has the largest population in the city, with more than 13 million at the last official census number in 2011. Its own trains carry 6 million people a day, a figure that leaves almost every other busy city embarrassed. Mumbai's population has soared in the last 20 years—and has actually doubled since 1991—when migrants from rural areas moved to the city looking for work. The practical reality of this flux is grim: reports the World Population Review, 41 percent of residents in Mumbai and surrounding areas live in slums. If you're looking for a silver lining, Mumbai may still be growing, but the pace is slowing. In 2019, Mumbai was the 8th city on this list. Another great thing about Mumbai, Reader's Digest found it to be one of the most honest cities in the world. testing/shutterstock Recurring population: 20,462,610 people The second largest municipality in China has almost as many inhabitants as the rest of Australia. And the population has not only increased at a steady clip since 1975; projected to continue improving along the way until 2035, according to the UN World Urbanization Prospects report. One serious drawback for such a large population in urban areas: Beijing has some of the worst air to breathe, thanks to polluting coal plants nearby and car traffic — measuring 52 microns per meter as reported by Unfortunately, it's also one of 11 major cities running out of water. image alliance/Getty Images A safe population: 20,900,604 people the CapitalEgypt has lived in at least since the 4th century due to its important location on the Nile. After the plague in the Middle Ages and the riots that devastated the city in the 1950s, it has since grown rapidly. Even the city's core population is very high — 12 million as tallied by the World Population Review. Alexandria, Egypt's second largest city, is only 30 percent the size of Cairo. Of course, you don't have to travel that far to reach a city rich in history. Try visiting one of America's best cities for history buffs, instead. Hafiz Johari/shutterstock Population: 21,005,860 PeopleBusiness Insider calls Dhaka the most crowded city in the world in 2018, and has only grown since then. With over 23,000 people per square kilometer and an incredible 2,000 people per day moving to the Bangladesh capital. The reason for the influx: pure and simple desperation, because natural disasters ravaged by climate change wreak havoc in their home towns and villages. Not surprisingly then, a quarter of Bangladeshis live below the poverty line, with an estimated 3 million people living in Dhaka slums alone. Instead, look at the smallest country in the world. Aleksandar Todorovic/shutterstock Denser population: 21,782,378 people Economic power plant, Mexico City is also one of the most densely populated and densest in the world. In fact, 20 percent of the entire Mexican population lives in Mexico City. The surge in growth has meant that the city has had difficulty keeping up with the services it needs for its residents, such as housing, but there is hope on that front: Its population grew only 0.5 percent from 2019 to 2020. Tacio Philip Sansonovski/shutterstock Poor population: 22,043,028 of America's most populous cities, with more than 11 million people living in the city itself, are the world's most sophisticated and ethnically diverse cultural centers that are also, oddly enough, according to Forbes, home to 26 billionaires. It's also an immigrant city—81 percent of students say they are descendants of foreign immigrants, writes the World Population Review of a recent survey by the University of Sao Paulo. The metropolitan area is projected to reach 23 million by 2030. If you're feeling a little claustrophobic just reading those numbers, we'd like to suggest these small American cities are going to pay you to move there. TonyV3112/shutterstock Faster population: 27,058,480 PeopleShanghai is the largest proper city in the world, and one of the fastest growing for 20 years, seeing double-digit growth almost every year since 1992, with the exception of the global recession of 2008-2009, said World Reviews. And it's still growing, even The rate of growth is slowing. Experts predict its larger metropolitan area will reach 50 million residents by 2050, which is sure to exacerbate all the problems that come with dense cities, such as inadequate infrastructure and pollution. Shanghai is unlikely to make a list of the United Nations' good countries —those that make a positive contribution to the world—anytime soon. Don Mammoser/shutterstock Population: 30,290,936Delhi, the capital of India and its centre of government, ranks second in the population and leads in the world's most polluted cities. It packs more than 11,000 people into each of the 1484 square kilometers. And it's growing faster than almost anywhere on Earth. In 2001 alone, reported the World Population Review, its population increased by 215,000 due to natural growth and 285,000 through migration. The number increased this year by 3.03 percent compared to 2019 but is still on track to reach a population of more than 43 million by 2035. Jirat Teparaksa/shutterstock Population: 37,393,128Believe people or not, the world's largest city is actually seeing a population decline of .11 percent from 2019. That trend is expected to continue and increase until 2035, so that 16 years from now, Tokyo will accommodate nearly 1.5 million fewer people than it is today. Needless to say, this is the kind of population trend that will benefit the entire city on this list! Now that you know the world's largest cities, see how America is catching up with the fastest growing cities in the U.S. Source:World Population HistoryUnited Nations: World Popoation Prospects 2019World Population Review: World City Population 2020O Globo: Rio is the city wkh the largest population in slums in BrasilBank World: Transforming Karachi into a livable and competitive megacity: the diagnostic and transformation strategy of the city (UK)United Nations: World Urbanization Prospects ReportReuters: China's capital Beijing vows to improve air quality but does not give targetBusiness Insider: Shocking photos show what daily life is like in Dhaka, world's most crowded cityForbes: Everything You Need to Know About Sao Paulo, Brazil's Largest City Originally Published : November 18, 2020
