If you're shopping for a new TV, then look no further. TechRadar has brought together the largest, brightest and smartest TVs to ever go through our eyeballs. The best performing TVs can be expensive, but you need to think of it as an investment that will return value over many hours and years, and will benefit your whole family. Most of the 2020 TV channels haven't arrived yet, so many sets below are from 2019, but don't let that put you off. Upgrades between generations of TV tend to be small steps, so you won't miss a huge amount by sticking to these models. Remember, all these TVs get software updates on the internet anyway. For now, you can choose safely to switch to one of these best performing TVs currently on the market. Is it better? Check out our picks of the best 65-inch TVBest TV At a glance:Samsung Q90R QLED TVLG CX OLED SeriesBest 8K: Samsung Q950TS QLED TVBudget OLED: LG B9 OLED SeriesSamsung Q80T QLED TVBest TVLast year, the Samsung Q9FN was the beaten TV. It has won praise galore for its features and image quality, not to mention its excellent improved smart platform that came with Bixby support and Samsung SmartThings. However, it was not perfect and there were legitimate complaints about viewing angles and an overly aggressive local gradation system that crushed the detail just above the black. Samsung has clearly taken these criticisms to heart, and directly addressed in the Q90. The new model has a visibly superior viewing angle that holds its own against an OLED TV, and the local gradation offers deep blacks without losing the details of the shadow. To this end, the new Ultra Black Elite filter is nothing less than a revelation, rejecting ambient light in a way that only staggers belief. The Q90 is capable of providing images that can compete directly with an OLED, with natural colors, bright reflections, deep blacks and well-defined shadows. It can also outperform any OLED when it comes to HDR, with images that are often breathtaking in their details and dynamic range. In fact, our only real criticism would be that, unlike some of the competition, the Q90 doesn't support Dolby Vision. However, in all other respects, the Samsung Q90 is an absolutely stellar new Samsung TV that takes QLED to another level. Read the full review: Samsung Q90R QLED TV (Image Credit: LG)The LG CX OLED is definitely the best OLED TV for and fully deserves to scratch the top of this list for the best TVs available today. Iterating on last year's LG C9 Series, the LG CX might not look so different - and it isn't. But by continuing the same mesmerizing image quality and webOS smart platform standout, with some modern updates like HDMI 2.1 and an A9 Gen 3 processor, it has managed to outperform its predecessor. With a new 48-inch OLED TV size now available too, the CX is an even more flexible proposition for a wider variety of portfolios and With a slim design and support for Dolby Vision and Atmos - as well as built-in sound - it's a fantastic choice at any size. LG is really looking to attract players with its 2020 range, too, with rock-bottom entry shift, support for Nvidia G-Sync, and compatibility with 4K/120HZ gameplay for next-gen consoles. You won't get HDR10 here, unfortunately, and UK viewers will have to go without all their fave catch-up apps, but make no mistake - this is the best OLED TV for you in 2020.Read the full review: LG CX OLED (Image Credit: Samsung)85 inches: Samsung QN85Q950TS 75 inches: Samsung QN75Q950TSAwesome image qualityStandard-setting HDRNo Dolby Vision supportLimited 8K contentThe Samsung Q950TS represents the manufacturer's latest 8K TV. Combining all the benefits of last year's Samsung Q900 8K screen with innovations first introduced the flagship Samsung Q90 4K TV flagship that hit the shelves earlier this year.Combined in a high-end QLED TV, the new Samsung Q950 offers an 8K panel and image processing enhanced by AI, as well as wider viewing angles, improved black filter and standard HDR performance. If all that wasn't enough, Samsung's smart TV platform is the most comprehensive on the market. So if you're looking for a state-of-the-art Samsung TV - and don't mind paying the top dollar for it - the Q950TS should be at the top of your short list. Read the full review: Samsung Q950TS 8K QLED (Image Credit: LG)55 inches: LG OLED55B9 65 inches: LG OLED65B9LG cheaper 2019 OLEDRich colors and sharp detailsNo the latest hdR10 processingNo HDR10 - The LG B9 OLED absolutely keeps its promise - to give buyers a cheaper way in an OLED world, with marked contrast and bright colors that implies. Inevitably, there are a few cut corners to get there, and you don't get the excellent experience of the C9 or E9 - while the delayed launch of the budget B9 model, and the continuation of price reductions to more premium sets, means this year's B-series is not quite the deal it would have been a few months ago. If the B9 is all your budget allows, it's a solid purchase, although scrimping and saving for the LG C9 OLED - and keeping an eye on it in Black Friday and cyber Monday sales - may be a better long-term decision. (Image credit: Samsung) New for 2020, the Samsung Q80T QLED builds on the successes of previous models for a shiny HDR TV certainly worth checking out. The most notable feature is the incredibly low input lag, making the Q80T a great choice for players who want to Responsive gameplay, but the QLED screen will also make general look a pleasure all around. The Q80T is the cheapest 2020 Samsung TV to come with a full backlight, which means you'll get consistent brightness, but not some of the high-end qualities of high-end sets - hence why it lands lower on this list than the last Q90 QLED. It's also not as stylish as the Q950TS zero bezel, with a thick body compared to other QLEDs in this year's range. However, you'll still get Samsung's latest Quantum 4K processor, bright HDR colors and advanced smart TV features with the Tizen operating system. If you want more of a saving, too, the Q70R QLED is the predecessor of this TV, and will cost you a few hundred dollars less than the new Q80T model (yes, it's certain product line, and yes, naming is confusing). Read the full review: Samsung Q80T QLED TVHow to buy What is TV technology the best? What is the best LCD TV? What screen size is best for your living room? What is the difference between LCD and LED TVs? The answers are not always obvious. In fact, buying a new TV can be stressful even for technophiles - because there are so many brands, so many features, so many screen sizes, colors, technologies and flavors to choose from. So which one is good for you, your family and your living space? In this guide, we'll guide you through everything you need to know about buying a new TV. What kind of television is there? There are many different types of screen out there, all working in different ways to produce the same results. Each technology has its own unique strengths and weaknesses so here are some basics to consider: LED TV: Direct Led These screens are backlit by an array of LEDs (light-emitting diodes) directly behind the screen. This allows for localized gradation - that is, adjacent areas of brightness and darkness can be displayed more efficiently - and significantly improves contrast. LED TVs are also more energy efficient and capable of a wider colour range than CCFL sets. Due to the extreme cost of mounting these LED ranges, cheaper TVs usually use Edge-Lit LED screens on direct or full LED screens. LED TV: Edge LED With these TVs, LED backlights are mounted along the edges of the panel. This setting allows for radically thin displays and offers contrast levels higher than CCFL, but cannot achieve the same image quality as directly lit LED sets. However, they come in much cheaper, which is why most LED TVs out there now use this technology. OLED TV The backlighting of THE OLED sets (organic light-emitting diode) is made by passing an electric current through an emitting light-emitting film. This technique produces much better colors and contrast and also allows screens to be extremely thin and flexible. It's Holy Grail display technology and LG, Sony, Philips and Panasonic have all adopted it in their flagship sets. Quantum Dot Quantum Dot is Samsung's great game in the LED TV space. With it, the brand claims that it is able to produce more colorful images than LG and Sony while offering even brighter panels. LG's Super UHD TVs all use a Quantum Dot variant called Nano Cell, and Hisense manufactures a number of Quantum Dot Dot TVs the United States and China.Curved TV Some manufacturers still make TVs that have slightly curved screens. But unlike old CRT TVs, the curve is inward rather than outward. The idea is that it makes every pixel equidistant with your eyes, offering a more satisfying image. However, there are drawbacks for this type of screen, the main one being that if you sit far enough away from one side - more than 40 degrees or more - the curve clearly begins to affect the geometry of the image, shorten

the content near you and compress the center of the image. What resolution technology should I follow? HD HD TVs are in two resolutions. Sets with HD ready are required to be able to display a minimum image of 720p, and usually has a screen resolution of 1366 x 768 pixels. Meanwhile, Full HD TVs have a higher resolution of 1920 x 1080 pixels. It is strongly advised not to go for anything other than full HD these days. Ultra HD and 4K Ultra HD resolution is exactly four times higher than full HD - 3840 x 2160. This means a much more detailed image, with content requiring much more bandwidth and storage space. 4K TVs tend to be good to high-end HD video to Ultra HD, but there are currently very few options for watching native 4K content. Learn more about 4K resolution.8K If 4K isn't enough to impress you, there are now lots of 8K TVs entering the market. This ultra-ultra-high-definition format packs four times as many pixels as 4K, for even sharper, sharper images. The difficulty is that there is little 8K content available - nothing on Netflix, for example! This means that these sets need very advanced processing to make high-end HD or 4K content for 8K screens, and while it is not yet a must-buy technology, this is definitely where the TV market is going. Learn more about 8K resolution. HDR No doubt switching to HDR video could make a more dramatic difference to your viewing experience than switching from HD to 4K. Like fixed HDR images, the mobile version expands the reach of the light and dark ends of the spectrum, providing more detail for both. HDR needs new shooting methods though - at the moment there is no way to backfill HDR in existing video. It also needs new TV technologies too, with Samsung the only ones to create specific screens, although LG and Sony will be able to update some of their existing stock to be compatible. Buying a flat-screen TV is a major investment that you can't take lightly. Just jump into the nearest store and grab the first plasma or LCD you see won't get you the best deal, the screen that suits your needs, or the equipment you need to get the most out of your new purchase. Size mattersSee people tend to choose the size of their flat TV based on the amount of space they have for it, it's not necessarily wise. Flat TVs take up a lot less space than you might think, so your new TV may end up foot or two further away from your viewing position, making the image look smaller. In addition, with hi-def, you can have a larger screen and the same viewing distance without worrying about seeing imperfections inherent in the source. The lack of noise of a 4K TV means that the ideal distance to sit from the screen is three to four times the height of the TV. How big tv should I buy? How many HDMI sockets do I need? For a living room TV, you should be looking for a minimum of 3 HDMI inputs. If you want to attach a set-top box as well as game consoles, etc., these HDMI ports fill up quickly. (Image credit: iStock) Do I want to hang my TV on the wall? First, you will need to consult a construction expert to verify that the wall in question is strong enough to support a flat screen. Then find out if the set you want is designed to be mounted on the wall and, if so, ask if the relevant support is included in the basic package or as an additional option. Will I connect it to a home theater? If the answer is no, you may want to think more carefully about the audio performance of your set. Look for a screen that can go as strong as you will need without distortion or cabinet rattle. Consider how the dialogue sounds and how much low-end bass rumble is capable of. Conversely, there is no point in paying more money for the exceptional built-in speakers if you already have a decent home theater system. Other shopping guides to consult
