This week, Nokia is re-reviving its mobile gaming service, N-Gage, in a format that it hopes will be more popular for legions of mobile phone users who wanted to kill time on public transport by playing Tetris. Four years ago, Nokia entered the mobile gaming market with a taco-shaped device called N-Gage, which was essentially a poorly designed mobile phone. It wasn't that good, so Nokia redesigned it a year later, eventually selling two million pieces, pretty pathetic, for the fact that Nokia sold 100 million mobile phones last quarter alone. So Nokia thought better, got rid of the hardware in 2005, and retooled the N-Gage not as a standalone device, but as an integrated piece of software for its smartphones. In the process, it sounds a social-networking feature (all the rage today, apparently), such as the ability for players to recommend games to friends, play against each other, and brag about their high scores. Mobile phone gaming is a \$4 billion industry, as reported by The New York Times today, so it's no surprise that Nokia wants to get back into this lucrative market. What remains to be seen is whether there will be enough interest in such a small niche of phones. While each of the company's 125 million smartphones - the only phones capable of operating N-Gage - were allowed with a gaming platform (which initially won't), the number of people actually using the service will most likely be relatively low. M: A Metrics survey in March 2006 showed that only 24 percent of U.S. mobile phone owners actually played the game on their phone that month, and only 2.7 percent downloaded the game, citing lack of interest and cost of games as their main reasons. Look at your phone. It is likely that there are several, very simple games out there, most likely Tetris or Bejeweled. How often do you play them? Also, what's your phone? Is it a \$500-plus smart phone (the type needed to use the N-Gage), or one that you got for \$50 after indenturing it to the carrier for two years? What kind of phone do you think is more popular? If Nokia goes to a good job of convincing consumers that new games and features of their N-Gage service justify not only the initial cost of buying a high-end smartphone, but the estimated \$10-\$15 it plans to charge for games, the third iteration of the N-Gage could end up just like the first two.
