Cell vocabulary quiz

29 Questions Total Attempts: 178 Plant Blood Vessels of the Blood Cell Division What statement is not part of cell theory? All organisms are made up of cells. Cells are the basic unit of life. Nothing can be done from a single cell. All cells are made up of other cells. What is a frozen substance inside cells that contains molecules for nutrition? What movement of molecules requires energy? Which organeritis provides energy to the cell? Tip: It has its own ribosomes and DNA. Which cells have a nucleus? Centrioles helps with mitosis. All cells have a cell wall. Endocytosis occurs when fluids enter the cell by bending into the membrane. Exocytosis is the release of substances from the cell by fusion with the membrane and the vesicle. Organs are structures outside the cell that perform specific processes. allows some things, but not all, to pass through the cell membrane. The model that describes the movement and arrangement of the cell membrane is . What are the two types of endoplasmic Reticulum (ER)? Endoplasmic reticulum - interconnected membranes that produce, process and distribute proteins Which organelle is the brain of the cell? It stores DNA. Solid particles entering the cell by engulfing the particle Diffusion of molecules assisted by protein channels Converts solar energy into chemical energy is a solution that has an equal concentration of particles compared to another solution. is a solution that has a higher concentration of particles. A solution with a lower concentration of particles is a . These are parts of the cell membrane. What is an organese that forms proteins by connecting amino acids to each other? The vacuole releases excess water, food and enzymes from the cell. The diffusion of protein-assisted molecules is . The difference in concentration from one place to another is this: it forms a boundary between the inside and the outside of a cell. It is actually a double layer. Are the cause of green plant leaves Converting chemical energy into solar energy Converting solar energy into chemical energy Converting solar energy into potential energy Just Scroll Down To View and Print. When you're done, just click Back on your browser. Should be a breeze, but if you have trouble checking the bottom of this page. Name - 1. tissue of the central, essential, or highly concentrated part around which other parts are grouped. 2. Vacuole a musical instrument composed of a attached to a device that forces air through a number of pipes to produce a Range of sounds; pipe organ. 3. chromosomal storage areas of the cell known to store mainly water and/or food. 4. chlorophyll (chlorophyll) the ground protoplasm of cells outside the nucleus. 5. Bean-shaped cell membrane, this cell organestd helps to take food and make energy from it. 6. chloroplast A structure inside the nucleus where RNA is transcribed. 7. Cell wall of cell mass as in an animal or plant body, especially as they form a specific organ: 8. Thin nucleolus, intertwined pieces of DNA found in the nucleus of the cell. 9. Organ the green pigment (color) found in chloroplasts where photosynthesis takes place. 10. cytoplasm Mainly made of cellulose, it is the hard and rigid outer layer of plant cells. 11. nucleus of an egg-shaped body that appears green with all the chlorophyll they contain. Photosynthesis takes place at this organelle. 12. mitochondria The cell enclosure that provides the body for all organelles.
