## Phen375 side effects

FASENRA is a maintenance supplement in patients 12 years of age and older with severe eosinophilic asthma. It does not apply to other eosinophilic conditions or sudden breathing problems. Nearly 7 in 10 adults with asthma may have eosinophilic asthma. Signs of eosinophilic asthma include: You often use a rescue inhaler to control asthma symptoms. You've had asthma attacks that required emergency room visits or emergency care. Have you taken oral steroids like prednisone for asthma. You wake up at night because of asthma symptoms. FASENRA is intended for target cells in the body called eosinophils (e-o-SIN-o-fil), which may be a key cause of asthma. It can help improve breathing and prevent seizures. In addition to current asthma treatments, FASENRA has been clinically shown to help reduce the occurrence of asthma attacks by up to 51% and improve lung function. Most doctors and patients prefer an 8-week dose schedule compared to a 2- and 4-week dosage.§ You may decide to get an injection in the doctor's office, or self-administration using FASENRA Pen until your doctor has shown you how to do so. FASENRA may cause serious side effects, including: allergic (hypersensitivity) reactions, including anaphylaxis. Serious allergic reactions may occur after the injection of FASENRA. Allergic reactions can sometimes occur hours or days after injection. Tell your healthcare provider or seek urgent help immediately if you have any of the following symptoms of an allergic reaction: swelling of the face, Do not use FASENRA, if you are allergic to benralizumab or any of the components of FASENRA, use mouth dropouts or tongue if you are allergic to benralizumab or any of the components of FASENRA. Do not use to treat sudden breathing problems. \* The content is not intended as a substitute for professional medical advice, diagnosis or treatment. Always seek advice from a doctor or other qualified healthcare provider with questions you may have regarding your medical condition. Tamxifene blocks the action of estrogen, a female hormone. Some types of breast cancer require estrogen to grow. Tamoxifen is used to treat some types of breast cancer in men and women. It is also used to reduce a woman's chances of developing breast cancer if she has a high risk (such as a family history of breast cancer). How am I supposed to take tamoxifen? Follow all the instructions on the recipe label. Do not take this medicine in large or small amounts or for longer than recommended. Measure the liquid medicine with a guaranteed dosing syringe or a special dose measuring spoon or medicinal cup. If you are not using a dose-calibration device, ask your pharmacist. Tamoxifen can be taken with or without food. When using tamoxifen need frequent blood tests. If you need surgical or medical tests, or if you need you may need to stop using this medicine for a short time. Any doctor or surgeon treating you should know that you are taking tamoxifen. Check your body checks and mammographs regularly and check your breasts for lumps every month while using this medicine. Use tamoxifen regularly to get the most benefits. Before you run out of medicine completely, fill your prescription. You may need to continue to use these medicines for up to 5 years. Store at room temperature away from moisture, heat or cold. Don't freeze. Precautions Should not be used with tamoxifen if you are allergic to it. Tamoxifen should not be used to reduce the risk of breast cancer if you are also taking a blood thinner such as warfarin (Coumadin, Jantoven). Do not take tamoxifen if you are pregnant. It can harm the unborn child. Avoid becoming pregnant while using this medicine and for at least 2 months after stopping treatment. Hormonal contraception (such as birth control pills, injections, implants, skin patches and vaginal rings) may not be effective enough to prevent pregnancy while taking tamoxifen. Use a barrier or no hormonal contraception (examples: condom, spermiiid diaphragm or intrauterine device/IUD). If you are taking tamoxifen to reduce the risk of breast cancer, you may need to take the first dose while you are menstruating. You may also need to take a pregnancy test before you start taking tamoxifen to make sure you are not pregnant. Follow your doctor's instructions. Taking tamoxifen can increase the risk of uterine cancer, stroke or blood clot in the lungs, which can be fatal. Talk to your doctor about the specific risks of taking this medicine. To make sure that tamoxifen is safe for you, tell your doctor if you have: a history of stroke or blood clot;liver disease;high cholesterol or triglycerides (a type of fat in the blood);a history of the network; if you are receiving chemotherapy or radiation. It is not known whether tamxifene flies into breast milk or may harm the breast-care-old baby. This medicine has been shown to slow down the production of breast milk. Do not breast-feed while taking tamoxifen. Side effects Get urgent medical attention if you have signs of an allergic reaction to tamoxifen: hives; difficulty breathing; swelling of the face, lips, tongue or throat. Tamksifen may increase the risk of stroke or blood clots. Call your doctor immediately if you have: signs of a stroke – sudden numbness or weakness (especially on one side of the body), sudden severe headache, muddy speech, difficulty seeing or balance;signs of a blood clot in the lungs – chest pain, sudden cough, wheezing, rapid breathing, coughing up blood; signs of a blood clot in the leg – pain, swelling, warmth or redness in one or both legs. Also call your doctor immediately if you have: blurred vision, tunnel, eye pain light;unusual vaginal bleeding or discharge;changes in menstrual periods;pain or pressure in the genital area;new quasi-wire/liver problems — nausea, upper stomach pain, itching, tired feeling, loss of appetite, dark urine, clay stools, jaundice (yellowing skin or eyes); high levels of calcium in the blood – vomiting, constipation, increased tinge or urination, muscle weakness, bone pain, confusion, lack of energy or tired feeling. Common tamxifene Side effects may include: hot flashes;menstrual changes;flushing;nausea/vomiting;vaginal discharge; Weight loss. Always consult your healthcare provider to ensure that the information displayed on this page applies to your personal circumstances. Key word: tamoxifen. \* The content is not intended as a substitute for professional medical advice, diagnosis or treatment. Always seek advice from a doctor or other qualified healthcare provider with questions you may have regarding your medical condition. What are statins? Statins are a group of drugs used to treat high cholesterol. They work by reducing blood cholesterol levels, especially low-density lipoprotein (LDL) or bad cholesterol. Patients with high LDL cholesterol are at increased risk of developing cardiovascular disease. With this condition, cholesterol accumulates in the arteries and can lead to angina, heart attack or stroke. Therefore, statins can be important in reducing these risks. The American Heart Association recommends statins for certain people. You and your doctor should consider statins for you if you have ldl cholesterol levels of 190 mg/dL or higher cardiovascular disease are 40 to 75 years of age and have an increased risk of cardiovascular disease over the next 10 years aged 40-75 g. I has LDL levels of 70 to 189 mg/dLEnken: Statin guidelines for high cholesterol Your body needs a little cholesterol to work well. Your body gets cholesterol by eating certain foods and by ing it in the liver. However, there are risks when cholesterol levels are too high. Statins work to reduce cholesterol levels in the body. Statins do this by blocking the production of hm-g-coa reductase enzyme in the body. It's an enzyme your liver needs to extract cholesterol. Blocking this enzyme causes your liver to make less cholesterol, which in turn lowers cholesterol levels. Statins also work to make it easier for your body to absorb cholesterol, which is already built in your arteries. There are several real benefits to taking statins, and for many people, these benefits outweigh the risks of the drug. Clinical trials show that statins can lower LDL cholesterol levels by as much as 50 percent. Statins can also reduce the risk of heart attack and stroke. In addition, a 2010 study shows that statins play a small role in triglyceride levels and increase in HDL (good) cholesterol. Statins have anti-inflammatory properties that affect blood vessels, the heart and brain. This effect can also reduce the risk of blood clots, heart attack and stroke. These drugs can also help reduce the chance of rejection after organ transplantation, according to an article in the Journal of Experimental Medicine. However, more research is needed in this area. Statins are available under a variety of generic and branded, including:atorvastatin (Lipitor, Torvas)fluvastatin (Lescol)lovastatin (Mevacor, Altacor, Altoprev)pitavastatin (Livalo, Pitava)pravastatin (Pravachol, Selektin)rosuvastatin (Crestor)simvastatin (Lipex, Zocor)Some combined lekoví, takoder, sodium statin. These include: amlodipine/atorvastatin (Caduet)ezetimibe/simvastatin (Vytorin)People taking statins should avoid grape comine. Grape co grape comer can affect some statins and worsen side effects. This is especially true for lovastatin and simvastatin. Read the warnings that come with medication. If you have questions, ask your doctor or pharmacist. You can also read more about grape com grape come and statins. Most people can take statins without too many side effects, but side effects may occur. It's hard to say if one type of statin will cause more side effects than another. If you have permanent side effects, your doctor may be able to adjust the dose or recommend another statin. Some more common side effects of statins include: constipation DianeanauseaTe side effects are generally mild. However, statins can also cause serious side effects. These include: Muscle damageStatins can cause muscle pain, especially in high doses. In rare cases, they can even cause muscle cell fracture. When this happens, your muscle cells release a protein called myoglobin into the bloodstream. This condition is called rhabdomyolysis. It can cause serious kidney damage. The risk of this condition is higher if you are taking some other medicines with statins, especially lovastatin or simvastatin. These other medicines include: some antifungal medicines, such as itraconazole and ketoconazole cyclosporine (Restaurate, Sandimmune) erythromycin (E.E.S., Erythrocín Stearate, and others)gemfibrozil (Lopid)nfazodone (Serzone)niacin (Niacor, Niaspan)Liver damageCounty liver is another possible increase in nu-effective statin therapy. A sign of liver damage is an increase in liver enzymes. Before you start taking a statin, your doctor may do liver function tests to check your liver enzymes. They may repeat the tests if you show symptoms of liver problems while taking the medicine. These symptoms may include jaundice (yellowing of the skin and white eyes), dark urine and pain in the upper right abdomen. An increased risk of diabetesStatiní may also be caused by glucose (sugar) levels in the blood to increase. This causes a slight increase in the risk of type 2 diabetes. Read more: Statins and diabetes risk Confusion or memory problemsSome people have problems with confusion or memory while taking a statin, although research has shown conflicting results. If you experience these side effects, talk to your doctor. You may be switched to other medications. These effects usually clear up within a few weeks after you stop taking the statin. Taking a statin while following a healthy diet and getting regular exercise is a good way for many people to lower cholesterol levels. If you have high cholesterol, ask your doctor if a statin would be a good choice for you. Questions you might ask your doctor include: Am I taking any medication that might interact with a statin? What benefits could a statin provide me? Do you have suggestions for diet and exercise that could help me lower my cholesterol? Is it safe to use statins and alcohol together? Anonymous patient If you are taking a statin, be sure to talk to your doctor about whether it is safe for you to drink alcohol. If you only drink a moderate amount of alcohol and have a healthy liver, it would probably be safe for you to use alcohol and statins together. A greater concern when using alcohol and statins comes if you drink or drink a lot, or if you have liver disease. In these cases, the combination of alcohol and statin may be dangerous and cause more serious liver damage. If you drink or have liver disease, be sure to talk to your doctor about your risk.
