18 inch bike for what height

Children's bicycles are generally measured according to the size of the wheel and not the size of the frame. Remember, children grow very quickly and need to be taken into account when buying a children's bike, however, if you buy a bike that is just too big for your child, you will compromise your child's safety, and ultimately discourage your child from cycling. Age of Child Wheel Size 3 Years 12 4 Years 14 5 Years 16 6 Years 18 7 /8 Year 208/10 Year 24, Which Size Bike Do I Need? Adult bicycles, and those for 10/11 years or more, are generally measured by frame size. This is usually a measurement between the center of the lower bracket to the top of the tube seat. Riders Height In Feet &#amp;#x2013; Inches Mainly Off Road Use Frame Size Required On Road Use Frame Size Required Road Racing Bikes Frame Size Required 4 feet 8 to 5 feet 0 12 to 14 inches 13 to 15 inches 46 to 4 8cm 5 feet 0 to 5 feet 4 14 to 16 inches 8 inches 50 to 52cm 5 feet 8 to 6 feet 0 18 to 20 inches 19 to 21 inches 52 to 56cm 6 feet 0 to 6 feet 2 20 to 22 inches 21 to 23 inches 56 to 60cm + number one email question I get in my inbox : What size bike does my child need? Let's be honest, it's confusing! For starters, children's bikes are sized differently than adult bikes (depending on the size of the wheel, rather than the size of the frame). Although we are talking about a bike with certain wheel dimensions, the height of the standover and the height of the seat can vary greatly between manufacturers. Finally, while the bike could be advertised for a 5-year-old, about 5 years old are small, while others are huge. Under no circumstances will the two children be best served by the same bicycle. This means that you can find out the correct bike size without attempt-and-error, or pulling your hair out. We helped

hundreds of parents figure out what size kids on the bike get. Here are 3 tips to help you get the right bike size for the first time. 1) Know what wheel size your child needs kids bikes are sized according to the diameter of their wheels. The smallest pedal bikes start with 12-inch wheels, while larger bikes go up to 24-inch wheels. When your child is ready for a 26-inch, they are generally ready for adult size rides, although some bike manufacturers make smaller youth size 26 bikes. Balance wheels, on the other hand, start with wheels as small as 10, although most balance wheels have 12 or 14 wheels. The best way to start narrowing down which bike size your child needs is to determine which size of bikes they probably need. I'm talking about because we're based on the age range for children of average height. If your child is small or super tall, you may need a smaller or larger bike than the general range recommended here. Don't come to stress you—this is just a starting point, so get a basic idea of what your child probably needs it. Kids Bike Size Chart Remember that this is just the starting point. Use this chart to get a general idea of the size of your child's bike, but don't skip the steps below!!!! Wheel size Age Height Inseam 12 2-3 2'10-3'4 14-17 35-42 cm 14 3-4 3'1-3'3 '3'1 7 16-20 40-50 cm 16 4-5 3'7-4'0 18-22 45-55 cm 18 5-6 3'9-4'3 20-24 50-60 cm 20 5-8 4'0-4'5 22-25 55-63 cm 24 7-11 4'5-4'9 24-28 60-72 cm 2) Measure your child's height and inseam The next thing to do, is to measure your child. Don't skip this step or guess! If you are buying a bike as a gift, you should still be able to ask the child's parents to measure it for you. Lie and say that sewing clothes or something, if it must be a secret! Measure your child's inseam and height. You'll want to take measurements in inches (or convert to inches once you're done). Be sure to write these measurements and save them for our next step. 3) Check out the specs for Bike (or Bike) You're interested just because you think your child probably needs a 14 lap doesn't mean every 14 bikes can fit them. Different bicycles have different stand heights and min/max seat heights. It is best to look at the bike that will provide the best for your child. Not all bicycle manufacturers list standover heights for their bikes. If so, however, you should compare it to your child's inseam. The height of the standover is the height of the upper tube of the bicycle frame where your child will be placed when standing with one foot on each side of the bike. This means that your child's inseam must be at least as high as standover height. Ideally there will be a little more room than that for your child to maneuver the bike comfortably. Your child must be able to comfortably stand above the upper tube of the bike Another statistic that you should completely search for is the minimum seat height for each bike you are considering. How the minimum seat height compared to a child's inseam depends on whether you are buying a bike balance, a first pedal bike, or a pedal bike for a confident pedal. To balance the bike, you want to make sure that the minimum seat height is not higher than your child's seat length. This allows your child to keep their feet flat on the ground, learn balance and scoot. So if the bike has 12 minimum seat height, then you need to make sure that your child has at least 12 inseam. If not, look for a bike with a smaller minimum seat height. To balance the bike, you want your child to be able to place their feet flat on the ground while sitting in the seat if you are buying your child the first pedal bike, then you want to make sure that your child is as long as the minimum seat height or not more than 1 apart. This is because children who have not yet learned to pedal will want to be able to put their feet on the ground. This gives them stability and the ability to scoot if they feel so inclined. If your child already knows how to pedal (sans training bikes), then you can choose a bike with a minimum seat height that is 1-3 higher than their length inseam. This allows the child's feet to touch the ground, but not put the feet flat on the floor. This confident rider is at the small end of the size spectrum for this bike, but is still able to comfortably reach the ground. Do not buy a bike that has a minimum seat height of more than 1-3 longer than your children's inseam. They won't be able to touch the ground, they will fight to reach the pedals, and they are probably going to fight or get hurt. There are two ways to find all the information, such as the minimum seat height. The first option is to go directly to the manufacturer's website. Each decent brand will provide specifications for your bikes. If not, don't take time with your bikes. Some manufacturers have even created special tools to help you choose the right bike size for your child. We love the Woom size chart that you could send to your home and measure your child again! Another handy tool is the Guardian Bikes RideSizer tool to help you determine which bike size your kiddo needs online. Woom size chart makes choosing the right bike size easy! Your other option is to use one of our comparison charts. For each child's bike size, we've rounded up the list of the best available children's bikes and included a comparison chart with this information for you. This is a quick and easy way to find out which wheels are best suited to your child. Balance Bike Guides &#amp;#x2013; Comparison Charts: Pedal Bike Guides &#amp;#x2013; Comparison Charts: What To Do When Your Child Is In Between Sizes. It's harder when your child is at the top end of the recommended height/inseam bike. When this happens, we hear from many parents that they fear that the bike won't last very long and that their child will outgrow it quickly. This is a valid concern, because there are no bikes or money growing in the trees. If your child is quite a dang close to the next bike size, I generally tell parents to go ahead and size up. This is especially true if your child already knows how to tread and is a confident rider. You know your child is the best. Are they athletic and able to handle a bigger, heavier bike? Will they be sure they'll stand on their toes, or will they be afraid? If your child is not yet whiz on a bike, then stay on a bike of smaller size, although they will outgrow it soon. In this case, you may want to search for a used bike (or borrow a bike from a friend). You can buy an expensive bike a few months down the track after I've had a little growth spurt and are ready for the next bike size. Why size isn't the only thing that matters Yes, size is the first thing to think about when picking kids on a bike, but it's certainly not the only thing you should think about. Once you know what size bike your child needs, you should start thinking about things like weight (that's biggy), geometry, brakes, tires, whether to use training wheels, etc., etc. for more information on other things that you should consider, read our guide to buying a Quality Kids Bike. Rascals are a family of three about us. Kristen (mom), Blair (dad), and Parker (kiddo). We started Rascal Rides when Parker was born and we didn't want to give up our passion for cycling. As we learned, we shared. Over the years, we have tested hundreds of children's bicycles, helmets, bicycle trailers and more. Kristen is a USA Cycling certified trainer and loves to share her passion for cycling with other families. Blair is a bike geek, mechanic, and mountain bike addict. Parker is our resident tester and inspiration. If you see us on the sidewalk, be sure to say hello! Hi!
