Wolverine moviemaker pro

Your old 8mm reel-to-reel and Super 8 movies are degrading. Worse, the memories fade and the film is becoming more fragile sitting in the box. Turn your movie into digital now before memories are lost forever! Introducing the Wolverine Reels2Digital Moviemaker-Pro. A very simple-to-use device that will turn your movie reels into digital movies (no sound) with few swipes. It works like a typical projector where a reel up to 9 inches is mounted, a memory card is inserted, some buttons are pressed and the device will pull the movie and scan frame by frame to create a digital MP4 movie file that can be played on any computer, edited, uploaded to the Internet or burned to DVD. The Wolverine Reels2Digital Moviemaker-Pro pays for itself considering that photo labs are charging more than a dollar to digitize a single foot of film! INCLUDED MovieMaker-PRO Reel 5 110-240VAC Power Adapter USB TV-Out Cable RCA Super 8 Reels User Manual Adapter Page 2Page 3 © 1996-2014, Amazon.com, Inc. or its affiliates Spitzenrezensionen Neueste zuerst Spitzenrezensionen Order by phone: 949-458-9888 | Office Hours: M-F 9-5 PST Q: Wolverine Pro Tips? A: Wolverine Pro Tips: Film Cleaning, Hang Prevention and PowerDirector Nonlinear Edition by John Renzi Published February 14, 2019 Q: MovieMaker: The Video Produced by MovieMaker Is Nervous! A: What you have is a fragmented memory card. This happens if you delete or change the file names of the memory card using a computer. It will be solved simply by formatting the memory card using the format option on the drive. Q: MovieMaker: Do I receive the cluster size error message? A: Cluster size error means you are using a very old SD card (1 GB or less), are using a card larger than 32 GB, or have not formatted the card using the Wolverine drive. Q: My movie cannot advance or the output is nervous A: 1) Do not start scanning from the white cable. It starts at least an inch in the film. 2) Move the switch for 8/super8 as many times back and forth and then push all the way to one side. 3) Make sure the film is below the three white tabs as shown in the image below. 4) Try a different movie to make sure it is not a movie problem. Q: MovieMaker - Won't my movie go through MovieMaker? A: Some old film, split of 16 mm or Super8 reached a little wider than 8 mm or expanded into some sections due to age and for that reason the unit will have difficulty pulling the film out of its sprocket holes. work around this problem would get a small piece of 1x1.5 inch paper, fold it four times and wedge it between the edge of the swivel door and the track at the location shown in the image file below to prevent the door from closing all the way. Q: What are the different settings for sharpness and exposure (EV) A: A film that shows digitization the same 16 seconds of a super 8 home movie using 5 different settings: 1) Default; 2) high sharpness, default exposure; 3) low sharpness, default exposure; 4) default sharpness, exposure +.5; 5) Default sharpness, - exposure .5. Then a quick summary comparison of default vs low sharpness. Q: MovieMaker - Are all the video or parts of my video Jittery? A: This happens a lot if some of the holes in the film's sprocket are slightly damaged as shown in the following images and videos. To find out if that's the way away from the case with the Frame Adjustment option unit, you'll see the holes in the sprocket. Record for a few seconds and check if the holes in the sprocket look worn in the top section as shown in the video. One play around this problem is to roll the film into the empty reel and scan the film backwards. In this way, the unit will scan by grabbing the good side of the sprocket holes, then, using video editing software you can reverse playback and save the file by playing forward. Q: MovieMaker: How do I adjust frames? A: Please check the following video: Q: MovieMaker - If Wolverine MovieMaker starts acting erratic. A: If Wolverine MovieMaker starts acting erratic where it can start working right after connecting the power or not responding from the buttons, then the sensor under the pin pulling the film is clogged with dirt that came out of the film. Please use a can of compressed air and blow air to the left and right of the pin as shown in the video below. Please clean the film using a lint-free cloth before scanning to minimize this problem. Q: MovieMaker - My video plays at 30fps even though my movie was recorded between 16-24fps. A: The unit produces an MP4 file that runs at 30fps because today there is no chip that can produce a smaller FPS. However, all computer players have the option to reduce playback speed. For 8 mm reduce the playback speed to 60% and for Super 8 to 80%. In addition, you can use free video editing software like Shotcut from www.shotcut.org or any other video editing software to join files, slow playback, add text, voiceover, etc. If you are using a Mac, you can use the pre-installed iMovie app Q: What is the best video editing software for Windows A: Check the review below: Q: Wolverine F2D - I bought the Wolverine F2D from HSN. However, it does not work, the unit is freezing and the buttons are not working. A: The unit comes with a Micro-SD card. However, it is necessary to insert Small Micro-SD card into your adapter and push all the way until flush with the edge of the adapter, before inserting the SD adapter into the Wolverine. Please check the image below: Q:F2D TITAN – How to adjust the image crop? A: Unit in the OFF position Press and hold the C button and while holding down the C key press the power button. On the center screen of the ADJ double-click the right arrow button to highlight the ratio (change to yellow) and press the OK button. Ok. the left arrow button to decrease the value to zoom out or the right arrow button to increase the value and zoom in. Press OK to finish and press the power button to turn off the unit. Q: F2D TITAN / MIGHTY: I have thick European slides that measure about 3 mm thick. How do I scan these slides with the slide adapter? A: We recommend that you adjust the Slide Adpater as described in the following three-page PDF file link: Q: How do I adjust the image or video date? A: Wolverine units have no clock and the date is an arbitrary date. You can change the date when you import images/videos to your computer. Computer.
