Key features of the LZMA method: High compression ratio Variable dictionary size (up to 4 GB) Compression speed: Approximately 1MB/s at 2 GHz CPU Decompression speed: 2 GHz CPU Approximate in small memory requirements Small code size for 10-20 MB (depending on dictionary size) Decompresse: about 5 KB supporting multithester and algorithms that are very suitable for P4 hyper-threading LZ compression compression are embedded. LZMA GNU was launched under LGPL conditions. LZMA is also available under a special license for those who cannot use gnu LGPL in their code. If you want to use LZMA code, you can request page consultations, custom code programming, and required developer licenses for support: Send a message to the LZMA developer. Check information about the LZMA SDK as also. 7-Zip also supports encryption with the AES-256 algorithm. This algorithm uses a 256-bit long encryption key. It uses the derivation function based on the 7-Zip SHA-256 hash algorithm to create the key. The key derivation function generates a key derived from the user-defined text password. 7-Zip text uses a large number of iterations to generate password keys to increase the cost of detailed search for passwords. 7z is part of the 7 Zip program distributed under GNU LGPL. You can download 7-Zip resources and binary from Download Page. Applications that support 7z archives: WinRAR, PowerArchiver, TUGZip, IZArc. Links: Copyright (C) 2019 Igor Pavlov.
