## Manual nikkormat f3

This camera, released as Nikomat FT3 in Japan, was released as Nikkormat FT3 elsewhere. Produced from 1977 to 1979, it was the first Nikomat camera to use AMS lenses; the wider and up-to-date availability of the lens makes it a more attractive choice today than its predecessors. Non-AI lenses can still be used using the stop button to close the openings manually. Six years after the introduction of Professional F, nikomat's introduction in 1965 allowed Nikon to attract many more customers. FT3 was launched in 1977. The camera is robust (like other mechanical shutter Nikomat models) and is essentially identical to its predecessor, FT2, except for the automatic maximum body meter coupling automatic maximum opening indexing (AI) system. Due to the redirection of SLR user requirements to more compact cameras (e.g. Olympus OML and Pentax MX), Nikkormat FT3 barely lasted two years, until 1979, to replace it with FM. Can be viewed through the viewfinder and at the top of the body next to the movie-facing lever. The modern battery used is the Energizer EPX76. The shutter speed is the bulb, 1, 1/2, 1/4, 1/8, 1/15, 1/30, 1/60, 1/125, 1/250, 1/500 and 1/1000 seconds. The film speed from ASA 12 to 1600 is selected in the lower part of the shutter speed control ring. The mirror lock is reached through the lever on the upper left side of the lens base. Release cable compatibility: several threads allow the use of standard AR-3, AR-1 and AR-2 cables. The automatic timer lasts 8-10 seconds when completely wrapped; it is irrevocable. Links This page is dedicated to the excellent Nikkormat FT3 camera made by Nikon, Nikkormat FT3 was the last of the cameras made with a lock speed control ring and film speed dial mounted for a common axle around the lens, all future Nikon hand focus cameras will have their lock control on the right side of the top panel next to the film's pre-lever, as has always been the case for nikon professional 35mm SLR film cameras. As the last mechanical lock nikkormat's it has all the advances that have been made over time with the whole Nikkormat range, as well as some find the flagship Nikon F2 camera. Nikkormat FT3 is identical to the previous Nikkormat FT2, with the exception of the old Nikon prong (Bunny ear) appression system, which is replaced by the new Nikon AI (automatic maximum apocation index) system. It was designed to replace Nikkormat FT2 with the new Nikon FM, but market forces led to Einige Word-Funktionen können Google Docs nicht angezeigt werden und werden bei Änderungen entferntDetails anzeigenLetzte Änderungen anzeigen Digital presentation genuine Nikon Nikkormat FT3 service manual, parts and exploded Premium high-resolution scans from the original service manager. Nikkormat FT3, 1977-1979 Nikkormat FT3 camera was launched in March, 1977, two months before the electronic version of Nikon EL2, along with two larger brothers, professional models Nikon F2A and F2AS. These four cameras are the newer generation of precision SLR from the Nikon family offering more simple operation through a brand new automatic aperture indexing (AI) system lens body gauge coupling. These Nikons, representing Nippon Kokagu, Japan, by their creators - were built around the traditional famous Nikon bayonet mountain (F-Mount), widely considered one of the best 35mm SLR photography, the AI system allows most of the new Nikkor lenses to pair directly and automatically with the camera measurement system as the lens is locked at home. Thus, when installing there is no fumbling, there is no need to turn the appos ring to index the smallest and maximum appgos settings, which means that the lens mounting operation is almost error-free. Of course, Nikkormat FT3 has more to offer a serious photographer than easy lens installation alone. FT3 carries with it Nikkormat series of small SLR cameras tradition and cool operational conveniences of its immediate predecessor, Nikkormat FT2. And, of course, f3 continues as a standout companion camera F2 Nikons and electronic ELs offer exquisite fortitude and great reliability that have always been the features of cameras with Nikon/Nikkormat names. Some of the exceptional key features of Nikkormat FT3 are as follows: Technical Highlight: \* Rock solid, rugged and reliable Nikon bayonet mountain. Nikkormat FT3 is equipped with the same famous bayonet mountain employed by Nikon cameras since the introduction of Nikon SLR. To mark its strong, accurate seating and alignment of mounted lenses, Nikon bayonet mountain takes any Nikkor SLR lens, including all over 50 lenses during that time. \* Precise Nikon centre weighted measuring system. F3 functions time-tested Nikon Center Weighted (60/40) TTL (per-the-lens) measurement system final impact measurement accuracy. This system, long considered one of the most effective in producing natural appearance and balanced exposure, concentrates 60% of the measurement in the central part of the field 12 mm in diameter, visible in the skelevel, while measuring the entire field for perfect exposure. \* The camera is equipped with a Copal Square S vertical travel lock for reliable and error-free operation, especially when working with electronic flash drives. \* FT3 pentaprisim mounted accessory shoe provides a convenient flash unit connection and &lt;ebay@adorama&gt;The shoe has an ISO-type electrical contact for wireless connection to the mounted flash attachment, and also includes an electrical safety switch that eliminates the likelihood of electric shocks when the flash unit is not installed. \* Automatic MX switching mechanism. Another convenience to simplify flash performance with Nikkormat FT3 is the built-in MX switching mechanism ensures an automatic selection of the correct synchronization time when the shutter speed is set. This mechanism was adopted from the F2 Nikon camera provides much better convenience for Nikon users. \* FT3 uses a silver oxide battery power supply to ensure greater power stability at various temperatures. With a better range of high temperatures and, more importantly, safe for the environment compared to mercury cells. \* The newly designed film speed selector lock with a mechanism built into the end of the shutter speed selector lever ensures that the movie speed selector remains set to the desired speed. Possible accidental motion of the movie speed selector can be avoided. \* Even f3 neck droplets have been given attention, enhanced by cool durability by the hardest to use - a feature introduced with F2 Nikon cameras. \* Plastic flip control levers. The plastic coating on the camera timer and pre-filmed levers makes it easier to reach and ensure greater performance comfort. &lt;&lt;&lt;--- Credit: Images of Nikkormat FT3 above courtesy of Mr. KOH KHO KING @ creator & moderator of another local photgraphy community Photo Malaysia.com. Image copyright © in 2005 All rights reserved ID: 12355 Please respect the visual property of the contributing photographer. Nikkormat FT3, which has a strong productivity heritage and wide popularity among profitable and amateur photographers, certainly reflects the quality and tradition of Nikon products. While Nikkormat FT3 was the last of a fine series of many fines and first class made by Nikkormats since 1965, perhaps olympus OML and Pentaxes like the introduction of MX and redirected requirements to 35mm SLR users. Nikkormat FT3 barely lasted two years and withdrew from the list of Nikon products in 1979. Because of Nikon's answer to the problem of compact cameras, Nikon FM replaced f3. It was launched the same year as FT3, rose in popularity along with the compact version of electronic EL2 (also the last of the EL series), Nikon FE, which was launched a year later in 1978 (Both will be featured later on this site).
