## Ppl power outage phone number

By Benny Taylor Power outages can cause serious problems for your computer. If the current suddenly shuts down while you're working, you can lose valuable data, but the problem can easily be deeper than that. Your computer's operating system should always be shut down using the correct procedure to avoid damage to system files. You can keep your computer running at least long enough to save work and turn it off properly during a power outage using an uninterrupt power supply (UPS). A UPS has a large battery that provides backup power to your computer in the event of a failure. Uninterrupted power is used in the same way as any power band or surge protector. Plug it into the power outlet, then plug in the components it will protect into the plugs available on the UPS. Some UPS outlets will provide both emergency protection and surge protection. These should be used for your PC, monitor, and maybe one or two other devices that you want to protect yourself from sudden loss of power. Additional slots may be available that provide only protection against power surges without backup of the battery, and a phone socket or two are usually provided for surge protection. If power is lost, the UPS will continue to power your computer for as long as possible with its available battery capacity. It can only take a few minutes. The more aircraft they are expected to support, the less support they can provide. A UPS is usually designed to keep power running long enough to allow you to safely turn off your computer, not to run your computer equipment for a long period of time. When choosing a UPS, consider the devices you intend to support with battery backup during a power outage and select a UPS with sufficient capacity to carry them. A basic charge is the computer and monitor, so you can shut down the system in an orderly manner. You should also remember that the UPS battery is usually a lead acid sealed battery (SLA), and loses some capacity with each discharge/charge cycle. A wide range of UPS models are available, with a variety of capabilities and features. The more you expect the UPS to equip your equipment, the more capacity you need and the more expensive the UPS. Uninterrupted power manufacturers often provide free online tools allow you to determine how much equipment you need to support and for how long, so you can consider the models with appropriate capacity. While some UPS devices simply provide backup power, others include support software to interface with your computer to report the state of the UPS and to automatically shut down your computer safely when the battery charge is low. Buy a UPS with enough capacity to support your most essential computer equipment long enough for an orderly shutdown. If you want more capacity to keep working, it will be expensive. If you believe that the breakdowns that occur will be brief, brief, UPS devices for the consumer market are likely to meet your needs. In more unusual situations where power outages are likely to be frequent and prolonged and you want to use your equipment, you will need to consider using several high-end UPS products, perhaps supported by fuel-powered backup generators. Source: iMore In my home state of California, we are facing another seasonal weather disaster; power outages during windy days. During the first weeks of autumn, we see strong winds whipping through the valleys. Combine this with months of sunny weather drying out wild grass and brush and you've created a recipe for dangerous fires. Currently, large parts of Northern California are burning as the kincade fire spreads through Sonoma County. At the time of writing, 30,000 acres are on fire with only 10% containment. Nearly 200,000 residents are forced to evacuate. Because these planned outages could last several days, there is a lot of preparation that we need to do to wait for it in the dark. It's one thing to be lights free, and even a working refrigerator, but it's even harder to live a little normally when you don't even have a way to charge the phone you're using to stay in touch with your family or need to keep home rescue medical equipment running. I have some tips on how to prepare for planned outages, but these recommendations are good if you live in an area affected by planned outages or your home is prone to power outages of any kind. Family Safety First The first thing you should prepare for is a plan to stay in touch with family members in the event of an emergency power outage. Make sure your children have emergency contact outside of your neighbourhood or city. They may need to call Grandma and Grandpa for advice on how to reach you if your phones are inaccessible. Do you know where your pets are? Moms, fathers and children can be considered, but four-legged family members also need to be checked. If you have to leave town due to a power outage, make sure you have proper transportation (such as a pet carrier) for your furriest family members. Keep carriers in easy-to-find locations, just in case a power outage turns into an evacuation. Make sure your business electricity utilities has your current contact information. If power outages are expected, companies will send notifications to their customers in advance. Visit your electricity company's website or call to make sure the phone number and email address they have on file for you are up to date. Emergency Supply Kit Even if you're not in a planned power outage, an emergency supply kit is a good investment. Non-perishable foods (preserves) and water should be the first things you pack in your kit. Yes, you want batteries and flashlights, but food and water are a top

priority. I recommend packing a LifeStraw in your kit. Kit, you no longer have bottled water, LifeStraw can filter contaminated water for emergency needs. Don't forget to include pet food! Flashlights are incredibly useful during power outages and much safer than candles. The best type of emergency flashlight is the kind that has a hand crank, so you don't have to worry about batteries. Nowadays, a crank flashlight with a phone charger is an ideal purchase. Speaking of batteries, you should keep a few packages in a variety of sizes for things you didn't think you might need. A manual can opener is important for opening these non-perishable food cans. Without electricity, you will not be able to run your can opener. Chargers, chargers and more chargers. With zero electricity for a few days or even weeks, both will be the death of your gadgets. You shouldn't skimp on quality here. Get a high-end charger like the AC power plant, which can keep your phone charged for up to 100 hours, but also has an AC socket for laptops (don't use it unnecessarily, however, your phone is more important than your computer). Jes in some extra clothes in case you have to bug out of your home quickly. Clean socks and underwear will make a big difference. Keep some money in your emergency kit, about \$100 if you can float it. Are you able to set aside additional drugs? If this is the case, stock up on a week's emergency medication to make sure that you or your family members will not be without if the pharmacy is closed. Generating electricity generators are cumbersome and expensive, but they can also be an emergency source of energy when you really need them. If you are thinking of getting one, do so well before a planned power outage. They are the first to disappear from the shelves of hardware stores when the time comes. The state of California has specific generator regulations, but if you live outside of California, Briggs and Stratton makes a fantastic generator at a great price. Just owning an energy generator is not enough, however. Make sure you are well stocked on the fuel needed for your generator and make sure it is clean and usable. Test it every few months to make sure it is in good working order. Locks and motorized doors Do you know how to open your garage door without an electric door opener? You may need to learn manual mechanics, otherwise. Live in an apartment building that electronic fobs or key cards? Ask your property manager how they plan to prepare for an outage. Do you normally take the elevator from your building? Do you know where the stairs are? Are you able to take the stairs? If not, consider staying with a friend or family member who lives closer to ground level. Gas up the car During power outages, gas stations are left in the dark, too. Don't wait for a power outage to come up. If you know that your neighborhood will sink for a few days, gas up as soon as possible to avoid waiting in long queues at the last minute. It's also a good idea to have a five-gallon gas can with fuel in it handy in case you run out of gas and need to make an emergency trip somewhere. What about home electronic medical equipment? During a power outage, planned or not, homes with medical powered equipment do not receive special energy protection. An energy generator can help meet these needs for emergency medical equipment, but it is best to transport the family member in need of the equipment to a place where electricity flows freely. Some power companies offer a special program for homes with medical equipment, which can reduce your monthly energy bill, but can also help get appropriate alerts further before planned outages. Contact your utility to see if there is a basic medical program for which you are eligible. In some circumstances, the company will even schedule home visits to registered customers to ensure that they are aware of the planned outages and can prepare for them. Stay safe It's important to be prepared for any potential disaster, whether it's a power outage, an earthquake, a hurricane or a tornado. Remember to have a plan in place that your family knows well to avoid confusion and stay safe. Keep an emergency kit, one for each family member, nearby with at least one gallon of water per person per day and keep your chargers loaded so you can juice up your phones to stay in touch with the outside world. Be careful and don't be afraid of the dark. We can earn a commission for purchases using our links. Find out more. More.
