## Rockwell band saw fence

Reinforce the accuracy of your band’s saw with this Kregin precision band saw fence (model KMS7200). This fence can be adjusted in two dimensions and is easily parallel to the blade. The precision lens cursor reads the packaging off and improves cutting accuracy and repeatability for high production work. Incredibly strong and rigid ensures optimal durability and tighter workpieces (see larger). Most ribbon saw blades are not fully perpendicular to the front of the table. There is always little drift that prevents you from getting precise cuts even on the fence. But Kreg’s Precision Band Saw Fence easily adapts to the angle of driving steel to give you a whole new level of band saw accuracy. This fence attaches to most 14-inch ribbon saw directly from the box (including Jet, Delta, General, Grizzly and many others) and can be modified to fit many others by drilling one hole in the aluminum mounting plate. This tape saw fence allows you to perform a wide range of cuts. It adjusts both the drift of the blade and the perpendicularity of the blade (necessary when cutting thin lines). In addition, the fence can be removed and reassembled in a low profile position to move the blade guard closer to the workpiece. Last but not least, the fence can accept resawnd guides or our stops for use in additional applications. Rigid design The aluminium fence is incredibly strong, straight and built to last for years. There are t-holes at the top and top of the fence to add stops, resaw guides and other columns. Easy to remove When you don’t need a fence, remove it in seconds - no tools needed! Loosen the locking knob and lift the fence from the mounting rail below the surface of the table. Precision lens machine Magnified and easy to lock for even the smallest adjustments, the thin red line of the precision lens lens tester allows you to accurately define the fence for cutting lines, tenons, and more. Adjustable in two dimensions This fence is unique in that it adapts to fit perfectly on the table and blade. With two simple adjustments, you can set the fence to match the drift of the blade, which greatly improves the cutting accuracy. In 1986, Craig Sommerfeld was building his house and had to find a way to attach his condnant face frame to members of the kitchen cabinet carcass. A tool and die maker shopkeeper, but a woodworker by necessity, Craig had a problem. Because he didn’t want to nail them and then fill the kitt, he designed and built Craig’s Jig, a one-hole pocketeter made of steel and aluminum that allowed him to attach facial frames from inside the cabinet, where the joint could be hidden from view. During the gap years, Kreg Tool Company has become the director of Pocket Hole Technology. From Kreg Jig’s manual to fully automatic Pro Series machines offers to provide a solution that has changed the way thousands of woodworkers join the tree. Incredibly strong and rigid Aircraft-grade aluminum Two simple adjustments to blade drift The pre-drilled holes in the mounting rail fit most 14-inch chess Adjustable two-dimensional Anodized finish makes cleaning easier With a simple homemade jig, you can create cabinets that stand the test of time. Use shop grinders to help take tedium out of the process of grinding. Hand grinding, fertilization and scraping can be better than grinding power to specific applications. Most finishing materials contain dangerous chemicals, so it is important to protect the skin, eyes and lungs. I think you want to decide first whether you believe in the idea that the fence needs to be adjusted according to the angle of driving, or whether you believe in the idea that it doesn’t. Carter’s also makes a magnetic wristband fence, and that design doesn’t make any sense if you believe in adjusting the angle of driving. You just looked at the alignment before connecting the magnets. When I talked to Alex about Carter’s last woodworking show about re-setting up a band saw for sawing, he emphasized other adjustments and made me believe that the angle of travel didn’t matter. I have a Kreg fence with my 14 Rikons, and I’ve built a high saw fence: //lumberjocks.com/GregD/blog/21933 This year’s piece of re-sawing makes me want to match the height of my saw fence to my warehouse. The adjustment I fuss the most is to make sure that the fence is parallel – top to bottom – with the blade. And when I oversaw 80 lengths at 8/4, I want to be very sure that both sides of the fence are firmly attached to the table so that it doesn’t move when I have to press the work to hold it firmly against the fence. I usually notice that the resuscated workpiece (between the fence and the blade) comes out a little thick at the beginning of the cut and slightly thin at the last end of the cut. My cutting quality is usually OK, but not good, provided I am very careful about maintaining a slow feed rate. After all, if you plan to re-saw so that you have some thickness available to stop imperfections, things are pretty easy and the shop-made fence that attached to your top does just fine. My local Woodcraft has a shop made into a re-saw fence with its big band saw, if I remember correctly. If you want to do like David Marks and saw a lever with an almost perfect surface of sawdust, you’re going far from my kit. Greg D. Add new precision to your band saw! Designed by band saw expert Mark Duginske, the fence offers unprecedented rigidity, adjustability and accuracy. Features: Heavy, solid-pressed aluminum fence and dovetail bracket design provide plenty of support for rugged Two simple blade adjustments The precision lensing contact is enlarged and easy to read even for the slightest positional changes Finishing is anodized for easy cleaning Pre-drilled holes in the mounting rail suitable for most 14 strip saws Easy to remove - no tools Are needed Optional saw guides provide higher control, when adjusting strip saw blade drift (1) Kreg Precision Band Saw fence For more information Brand Kreg Manufacturer Part number KMS7200 Weight 8.900000 Tech Spec Material: Aircraft Grade Aluminium Mounting Rail Length: 26 Fence Length: 18 Length 18 You can also contact our head office directly, you can also contact our representative near you. If you only use your ribbon saw to make curved cuts, you probably never need a tear fence. However, a good fence for precise tearing and sawing will help greatly. A lot of music saws don’t have a fence. Sawmills with fences, especially with more affordable models, often do not work so well. The three fences we recommend are suitable for virtually any of the 14 strips and about 12 models. (Before purchasing, check with the fence manufacturer to see if its product works with a strip saw.) Kreg, my #KMS7200 factory fence is always at the sawmill. Not because I love it, but because I have to remove the blade before I can slide the fence from the right end of the rail! And that’s one of the main reasons I replaced it with the Kreg KMS7200 shown above, which lifts anywhere along its rail. The lock holds the 2-3/8 high fence firmly when sawing, even with long workpieces that apply greater force against the fence. The fine-tuning screws on the fence make it easier for the blade to drift. T-grooves for fence sports on both faces and at the top and bottom of the fence. So I can set it sideways to get from bladed directors to short, thin things. The microadjuster accessory (#KMS7215) turned out to be dead and worth the price. It attaches to the left side of the fence and helps accurately call for tear surgery. I used a microadjuster to find the exact center of 3/4 thick red oak and saved it again at that point. The resulting surgery showed almost no difference in thickness from end to end when inspected with caliber. —Tested by Bob Wilson, Techniques Editor For more information: kregtool.com; 800-447-8638 Rockler, #24504 For the price of competitors’ aftermarket fences, Rockler 24504 offers an auxiliary table with perpendicular miter sawing spots, a 3-high fence and interchangeable cucumber accessories. The 1-1/8 thick, 24-square-metre MDF table is easy to attach to the lane-tap table and offers almost twice as much surface area as typical factory tables. removing drift proved easy and intuitive; All I had to do was adjust two bolts. Bolt. T-square end bracket (attached to rails). After this adjustment, I was able to saw again 1/8 thick pieces of red oak, the thickness of which is not very different. The T-hole milled into the face of the MDF fence accepts feather boards, hold-fasteners or shut-off machines; but overtightness can crush thin walls. (I’d rather have an aluminum T-track on the fence.) When there is only one working face, this fence must be used with steel to the left - the downside of tilting the table because I like my workpiece to ride against the fence in that situation. Rockler contains a jig for cutting a circle up to 26 metres in diameter. --Tested by Craig Ruegsegger, Multimedia Editor For more information: rockler.com; 800-279-4441 Woodhaven, #7280 I want my ribbon saw fence to be intuitive to use, easy to take off and put back on, with T-grooves for installing jigs and accessories. Woodhaven’s fence does all that and more. It starts with two 24-5-5-000 aluminum rails that attach to the holes in my saw table without drilling. These rails slide left and right when they are not locked, which gives me a lot of options for the location of the fence. And while the fence can’t just be lifted off the tracks, it’s only five seconds of work to slide the rails to the right and then the fence to the left. There is no need to remove the blade. The fence itself is 24 long and 3 high in eight T-grooves and remains firmly unnying. It is easy to adjust the square to the table and correct the drift of the blade. I keep with me the handy stops that attach to the T-holes and prevent cutting on the tenon shoulders. Finally, Woodhaven sells this fence with an optional circle-cutting section (#7285) that attaches to the ends of the fence rails, allowing you to cut circles up to 31 1/2 in diameter . —Tested by Kevin Boyle, Senior Design Editor Further information: woodhaven.com; 800-344-6657 800-344-6657
