If this is the case, this can help > ... o-removal/ The problem with internet dating is that you never know if they are genuine... Abraham Lincoln tommyk Posts: 109Joined: July 7, 2005, 11:03 am posted August 28, 2014, 10:15 am I did as recommended and I'm still being redirected to a search engine I don't want. Here's what I get when I enter a search in the navigation bar: I forget to add that I just installed a new router and that's when the problem started. In addition, the searchquide.tds.net/ is also the name of my Internet service provider: TDS! A coincidence?! I want Google Search to be tds.net or anything else. What to do? Patrickidempsey Posts: 23734Joined: October 23, 2008, 11:43 AmLocation: Asheville NC Posted August 28, 2014, 1:36 pm Sounds like your service provider is hijacking your DNS. What is my avatar about: the edmeister Posts: 32253 Joined: February 25, 2003, 12:51 AmLocation: Chicago, IL, USA Posted August 28, 2014, 1:41 pm am I here? The TDS redirection service has been to provide useful searches for web address errors. You have entered an unknown name that the TDS TDS service to submit site suggestions that you may find useful. By clicking on any of these suggestions you provide with Yahoo! search results, which may include relevant sponsored links. Have you read this? ... TopIm6IXPQNothing to worry about. It's normal. (I think it reads like: Google web server after you've redirected to Google using SSL, i.e. HTTPS) I find that TDS is doing a DNS search redirect for failed or incomplete searches. Many broadband providers do this, and most provide a way to opt out of this service. A mind is a terrible thing to lose. Mine wandered off and I'm out looking for him. makaiguy Posts: 16890Joined: November 18, 2002, 6:44 pmLocation: Somewhere in SE USA Posted August 28th, 2014, 4:48 pm Your current DNS provider (usually your ISP) is intercepting DNS search failures and presenting your own search page. You can switch from the DNS service provided by your ISP to one provided by a different service to avoid such garbage. If you don't know what I'm talking about, this article may be of interest: ... ervers.htm Doug Wilson, The Makai GuyWin10 (64bit): FF 84.0.1 (64bit), TB 78.6.0 (32-bit) Android available, dammit! What a fool thinks he sees, no wise man has the power to reason out - Doobie Brothers tommyk Messages: 109Joined: July 7, 2005, 11:03 Posted August 29, 2014, 9:43 am Makaiguy: I think you're right. This all happened after I added a router to my wife's laptop. What a shit to do! However, what does it mean to change my DNS service? I followed the link I provided and I'm not sure if that's what I want or if it's actually easy to do. What will change if I do this? makaiguy Posts: 16890Joined: November 18, 2002, 6:44 pmLocation: Somewhere in SE USA Posted August 29th, 2014, 1:40 pm Your computer does not know how to go to a website by your web address name (e.g. mozillazine.com). When you click on a link, your browser asks your operating system to check the IP number (Internet protocol) for that address. Your operating system goes to the DNS (Dynamic Name System) server that is configured to use it for searching. The DNS server searches for the domain name and returns the IP number assigned to that domain name (for example, for mozillazine.com, it would return an IP of 216.55.178.173) to your operating system. Your web request for the link you clicked is sent to this IP number. This DNS search activity is done behind the scenes, so the user is usually not aware that any of this is happening. If all goes well, it is fast enough that there is not a notable delay introduced by the process. If you change the DNS server your system uses, nothing is different from a user point of view, as everything is taken care of in the background for your operation If DNS search fails, you would now get an unseen Site or similar error instead of being redirected to your ISP's bug management search page as it is now. My isps DNS servers used to be undersized because of the amount of traffic they received such that searches during busy times of the day often failed and I would have to click on links several times before passing. I switched to DNS servers at a local university and browsing performance was immediately improved. Finally, the university closed access when it is not physically connected to its network, but by that time my ISP had fixed its problem, so I am back using its DNS servers again. The article I was referring to has a link How do I change DNS servers?. Or do a web search to change the DNS and router model or your operating system. Doug Wilson, The Makai GuyWin10 (64bit): FF 84.0.1 (64bit), TB 78.6.0 (32-bit) Android 10: FF Mobile 84.1.2, No TB for Android available, dammit! (until this you can find it on all websites) And the final heym means Engine ID and also some random combination of numbers and cards is a cookie sent to our desktop.. Hope it helps. Other than that to get removed the redirection and tracking of this video is helpful RobertJ Moderator Messages: 10873Joined: October 15, 2003, 7:40 pm Location: Chicago IL/Oconomowoc WI Posted October 30, 2017, 8:21 am . Once you could figure out how to change your DNS servers are good and secure. In my case, my DNS configuration is on the router of my network and I have them set for 208.67.222.22208.67.220.220 which are opendns IP. FF 84.0.1 - TB 78.6 - Mac OSX 10.13.6 Back to Firefox Support Who are online users browsing this forum: Bing [Bot] and 1 guest Conexão segura é a forma mais comum used by browsers and aplicativos para trocar dados com outros serveres na Internet. To ensure that to comunicação é segura, or server fornece um certificado of security SSL, that must be emitido por um serviço especializado e pode be conferido online. Caso these different dados sejam, bone are configured to reject access automatically, which can result in a connection error. If you have A Google Chrome browser, learn how to resolve the SSL error. How to play offline on Google ChromeSL SSL Problems Site connections (Photo: Playback / Chrome) Google recognizes different types of SSL errors. Two have common solutions: The server has ERR SSL VERSION OR CIPHER MISMATCHPer weak ephemeral Diffie-Hellman public key – ERR SSL WEAK EPHEMERAL DH KEYAquesta web page is not available – to be displayed, it means that there is some server configuration error, meaning there is very little the end user can do. One tip is to try to reload the site using the ctrl+F5 command to force the browser to re-download items on the page. If it doesn't work, try accessing an unencrypted version of the site by changing the url protocol HTTPS:// HTTP://. But many servers do not allow this type of connection, automatically returning to the secure version. If these tips don't work, wait a few hours for the team responsible for the site to resolve the issue. If you wish, contact the service to let them know what is going on. This is also the recommended action when Chrome shows the ERR SSL FALLBACK BEYOND MINIMUM VERSION. What is the best Internet browser today? Comment on the TechTudo Forum. Another type of error that may occur is the date error: NET::ERR CERT DATE INVALID. But it is easy to resolve SSL certificate errors is to schedule Chrome to ignore errors and maintain the connection even if it is deemed unsafe. The recommendation is to use this method only for emergency situations, avoiding it in everyday situations that can be resolved in other ways, Step one, Click the Chrome shortcut on your desktop, then click Properties; Apps can be changed using shortcuts in Windows (Photo; Play /Chrome)Step 2, Find the Destination option and add the tag ignores certificate errors after the full shortcut. Then click OK. Change modifies chrome behavior (Photo: Playback / Chrome)Ready! Now when you start the browser through this shortcut. Your browser will automatically ignore any certificate issues on websites accessed. To undo this change, simply repeat the steps above and remove the shortcut label. Through Google Google
