How to adjust rainbird sprinkler head direction

January 18, 2018 Water consumption is becoming a huge dilemma in today's environment, but that doesn't mean you can't create [...] Read more February 1, 2016 Here's a great resource for all the information you might ever need about pesticides. this resource will give you [...] Read more January 19, 2016 Rain Bird is a great resource to use when you are trying to limit water consumption and become [...] Read more on January 13, 2016 Provided there is a small introduction to Xeriscaping that refers to water-wise or water-smart gardening. This little book focuses on [...] Read more December 2, 2015 In this section we provide several manuals along with additional information about the basic irrigation clock Springtime uses. If you need information about specific irrigation hours, please contact Springtime and we can provide you with further assistance. Read more December 2, 2015 This resource will give you instructions on how to adjust sprinklers along with how to choose the right [...] Read more When you own an irrigation spraying system, you benefit from automatic irrigation of greenery in your garden. It is true that sprinkler systems replace the chore of dragging a hose around the garden and watering it almost every day, depending on the season. Irrigation heads are only a small part of a more complex system. In today's article, we will tell you how you can adjust different types of spray heads to get the desired spray pattern. In most cases, you should be able to adjust the sprayer head yourself, as you do not need any other tools except for a flat screwdriver and possibly pliers (some spray heads have clamps that need to be compressed to rotate and adjust). Why we need to adjust sprinkler heads A very important part of owning a sprinkler system is the fact that your lawn only receives the amount of water it needs. This means that above or below the watering lawn is a no-go. If your sprinkler heads are not properly adjusted, they may end up causing puddles and watering or not watering certain parts of the lawn at all. Before we go any further, there are a few things you should know. First of all, not all spray heads are adjustable, and some of them have very specific spray patterns. If your irrigation head has a screw in the middle, it means that the arch is adjustable. The process of adjusting the spray head depends on the type you own. You can have a type of spray, rotating or impacting. The first type of sprayer will also bring streams of water. Rotor sprinklers spray one stream of water as they rotate around. Impact sprinklers are known to be able to cover wider areas and their mode of operation is very similar to the rotary species, except for their heads, which do not appear. Basics Depending on the spray head that you have installed, the process of setting the head should be quite basic. You will notice that the heads have an integrated spray nozzle which is basically a very small screw to help you adjust the sprayer head. All you need is a small screwdriver to tighten or release this screw until you get the spray pattern and density you require. As a general rule, if you have problems with overspray, just turn the screw clockwise. This should reduce the water pressure. Intuitively, turning the screw counterclockwise should lead to higher water pressure. Pop-up sprinklers Pop-up head sprayers are among the most common choices for yards around the world. Just as the name tells us, this particular type of head will rise from the ground as soon as the water pressure is detected. If you want to set up a pop-up head sprayer, the process is very simple. The first thing you need to do is make sure that the system is turned on, so its head will be visible to you to make the correct settings. With the help of a small screwdriver, you can then adjust the head, which should now be visible. As we mentioned earlier, turn the screw clockwise or counterclockwise, depending on whether you need low or high water pressure. The arc of the pop-up spray head is determined by the angle that forms the rotating sprayer. For example, installing the head in a circle will result in a circular area before it needs to be covered, and that determines the arc of rotation. Assuming that you want to spray a semicircle, the angle of rotation should be 180 degrees. To adjust the arch of the sprayer, you need to examine the top of the head to find the drawer, and then turn the head to the right and hold it. Another important thing to remember is that the size of the nozzle determines the radius of the spray head. The larger the nozzle, the larger the radius. If turning the screw helps to adjust the spray pattern, there is another process for adjusting the angle. The first thing on the list is determining what type of head you have. There are some models that will require you to move the entire body of the sprayer if you want to get the desired spraying angle. If for some reason your pop-up sprayer is hidden in the ground, you should use a shovel to dig around it and then turn on the water. By grabbing the body of the sprayer and turning it around, you can adjust the angle if you are careful with maneuvering to make sure that you do not damage the tube underneath. Rotor Sprinklers As we mentioned earlier, the setting of the sprayer head depends on the model. If you own the head of the rotor irrigator, you will need to adjust the arc and radius of spraying. Basically, this means that you can determine how far the spray head will spray and how far the irrigation head will turn when it is turned on. On you will find a screw to keep the rotor nozzles in place. We can not provide you with an exact set of rules for setting rotor nozzles, because it depends from one product to another. However, every other type of spray head should come up with its own set of instructions that will tell you how to make these adjustments. Impact sprinkler This particular type of sprayer does not allow you to adjust the radius, but you can adjust its arc. In general, these sprayers have clamps that are quite easy to squeeze using bare hands. However, if you find it difficult to do so, you may need a set of pliers. The first step to turning the head of the sprayer to the left, then squeezing the clamp and turning until it is against the card that extends down from the spray head. After that, you can move the head of the sprayer to the right side and adjust the remaining spasm in the same way. Correct position But how can you be sure that you have set the spray heads in the correct position? It is important to know that both rotor nozzle sprayers, as well as stationary spray heads, should be able to cover the area that leads to the next spray head, in all directions. Basically, you need to make sure that you have adjusted the spray head to cover the head to the head. If this does not happen, then there is a very high chance that you have placed your sprinkler heads too far apart. This is where things get a little more complicated as you have to redirect your pipes. This is a costly and time-consuming process and you may need the help of a specialist. Bottom line No matter what kind of sprinkler the head of your yard currently hosts, they should have very specific instructions on how to adjust spraying patterns, arch and radius. Each manufacturer shall include these specifications in the user/operating manual, together with other relevant information, such as how to install the spray head first, hose compatibility or disassembly and cleaning instructions. ShareTwitterFlipboardEmail Hunter Sprinkler Head Editing | Rain Bird R-50 Adjustments Walla Walla / Hunter Mp Rotator Adjustment Hunter PGP® - Sprinkler Head Arc Adjustments Adjustable heads are preset to approximately 180°. Sprayers can be seized with water on or off. It is recommended that you make initial adjustments before installation. Use your palm to turn the nozzle tower counterclockwise to the left stop to complete any interrupted rotation cycle. Turn the nozzle tower clockwise to the right. This is the fixed side of the arc. The nozzle tower must be held in this position to adjust the arc. The right stop doesn't change. Hunter PGP® - How to increase the arc Insert the plastic key ends of the Hunter key into the set drawer. Hold the nozzle tower at the right stop and turn Clockwise. Each full 360° turn of the key will increase the arc to 90°. Set any arc between 40° and 360°. The key stops rotating, or the ratchet occurs when the maximum arc of 360° (solid circle) is reached. Hunter PGP® - How to cut the arch Insert the plastic key of the end of the Hunter key into the set drawer. Hold the nozzle tower at the right stop and turn the key counterclockwise. Each full 360° turn of the key will reduce the arc to 90°. Set any arc between 40° and 360°. The key stops rotating, or a ratchet sound sounds when a minimum arc of 40° is reached. Hunter PGP® - Setting the radius and distance of the throw Insert the steel hexagonal end of the Hunter key into the radius adjustment screw. Turn the screw clockwise (into a stream of water) to reduce the radius or counterclockwise to increase the radius. The radius can be reduced up to 25%. Attention: Turning the set screw clockwise by more than five full revolutions may result in the loss of the radius set screw. Hunter PGP® - Adjusting precipitation speed If you have excessively wet or dry areas, you can replace the nozzle in the sprayer to increase or decrease the rate of precipitation. For dry areas, install a larger nozzle. For wet areas, install a smaller nozzle. Hunter PGP® - Nozzle installation Insert the plastic key of the end of the Hunter key into the sprayer lift drawer and turn 90°. Pull the risers up to gain access to the nozzle drawer. Using the Hunter steel hexagonal wrench, turn the screw to adjust the radius counterclockwise to make sure it doesn't block the nozzle socket hole. If the nozzle is already installed, it can be removed by pulling out the set screw and turning on the water or pulling the nozzle's ears out using needle pliers. Slide the desired nozzle into the nozzle socket. Note that the socket is tilted up to 25°. Ears should be set so that the range of nozzles screw threads directly between them. Then tighten the nozzle range screw. An elevated impact with an arrow on the rubber cover will always indicate the location of the nozzle and the direction of water flow when the sprayer is retathed. Hunter PGP® - Alignment of the right (fixed) side of the arc If the right side of the arc is not aligned correctly, the results may be wet pavement or dry lawn area. The right side arch can be easily aligned. One way to align the right stop is to rotate the entire sprayer superstructure assembly and mount below it, left or right to the desired position. This may require temporary removal of the soil around the sprayer so that you can grab the sprayer cover. Another way to restore the right arch is to unscrew the body cover counterclockwise and remove the inner assembly from the body. After removing the nozzle, turn the nozzle tower to the right screw the inner assembly back into the body so that the nozzle is aligned to the right side of the required irrigated area (Fig. 9). At this point, you have aligned the right-hand corner of the arc stop, and you can set the left arc to the appropriate setting. Note: It is not necessary to dig and remove the entire sprayer in order to line up the right arch. Note: Type G rotary sprayers are set in the same way as PGP. See the above instructions for installing and setting up PGP. SOURCE: HUNTER IRRIGATION Rain Bird R-50 Editing R-50 is an internal impact sprinkler. This means that there are two small stainless steel balls that act as a driving mechanism. R-50 Rainbird Setting To increase the arc - Keep in mind that the sprayer is preset to approximately 180°. Pull on the stem; pull the vandal collar out of the groove. Gently press on the nozzle and turn the nozzle to the right (clockwise). The arc is increased by the amount by which the nozzle rotates. For example, if the arc was previously set to 180° and was rotated 90° while the nozzle was pushed down, the sprayer will now have an arc of 270°. Be sure to replace the vandal collar when finished. To cut the arch - Pull on the stem; pull the vandal collar out of the groove. Lightly press on the nozzle and turn the nozzle to the left (counterclockwise). The arc will now be reduced by the amount that is rotated. Be sure to replace the vandal collar when finished. Change the arc to a solid circle - Remove the inner assembly from its sleeve. Pull the vandal collar out of the groove and turn the nozzle to the right (clockwise) until it feels strong resistance. It'll feel like it's locked in place. Put the vandal's collar back in the groove. Turn the nozzle to the right (clockwise), there should be no resistance at 360° speed. SOURCE: Rainbird Spray/Mister Head Type - Adjusting the direction of the watering stem can be adjusted to change where the pattern splashes. Spray / Mister - Spray pattern adjustment (only available on adjustable nozzles) Adjustable nozzles can be adjusted to fit from 0 to 360 degrees. Turn the collar directly under the top of the nozzle, or on some heads the collar is the upper part of the nozzle to the right or left to achieve the desired irrigation pattern. A common problem of sticking the head may indicate that the heads are worn and need to be replaced. Spray / Mister heads - Adjust the spray distance. 1. Turn the small center screw with a small flat screwdriver. 2. Turn the screw clockwise to reduce the spraying distance by up to 25%. Do not reduce more than 25% or the sample will fluctuate considerably. Walla Walla/Hunter Mp Rotator Adjustments Use the MP Rotator Settings tool for faster and easier editing. - Install the MP rotator with the left edge indicator pointing to the left side irrigation area. - With the water on and the mp rotator in the pop-up position, rotate the arc adjustment ring clockwise to increase the arc, counterclockwise to reduce the arc. - With the built-in ratchet function, you can fine-tune edge alignment by simply overriding resistance points to the left or right in both directions. The radius can be adjusted by up to 25% by turning the small screw on top of the nozzle using the mp rotation adjustment tool or the small flat sheet screw screw. The radius shall not be less than 25 %. SOURCE: Hunter Industries The above are guidelines for adjusting the most common sprayer style. Further resource adjustments are available below...
