Whether you're a professional or an amateur, visionary or a scientist, the extended OM system is designed to allow you to capture life this way it goes from photomicrography to astrophotography, from photojournalism to portraits. This remarkably compact, lightweight and functionally designed camera incorporates an electronic shutter and fully automatic exposure control, plus manual exposure control to the flip of a lever. As long as you use a camera in the OM system – even if the next body is not an OM-2 model, familiarize yourself with this camera and many accessories available is a good way to improve the image-taking capabilities, since the essence of the OM system is very thoughtful and most system accessories can find one way or another to fit into older or newer camera bodies. Before you start with this short course of instructions in this section, click here to open a new window to use the main reference map for illustrating different camera body control. WARNING: OM-2 can only start working after charging the batteries (or charging correctly with the correct polarity aligned inside the compartment). If you try to release the shutter without charging the batteries, this shutter is locked and the field of view becomes dark, turning off all functions. You need to reset the shutter to return the mirror back to the ascending position so that normal view through the viewfinder can resume... Not damage caused, but could cause some anxiety or panic in a relatively new human camera user automatically. [1] Charge the camera. [2] Set the ASA movie speed dial (right). The Film Speed dial is also acting as the exposure compensation dial, make sure that after adjusting the film speed, the exposure compensation value is still at its neutral level facing the mark of the index (I). Then just advance the film winding up a full stroke until the figure 1 appears in the counter exposure window (Pix to the far right). [3] Automatic Exposure Set the selector lever to the AUTO position. [3] Manual exposure Set the selector lever in the MANUAL position. [4] Automatic exposure preselects the lens aperture and look through the viewfinder to compose the image and focus on the subject. Make sure that the shutter speed scale is visible in the viewfinder. [4a] Manual exposure Look through the viewfinder, compose the image, focus on the subject, and determine Make sure that the overexposure and underexposure index marks are visible in the viewfinder. [5] Hold the camera steady and press the shutter button with a constant slow pressure to take the photo. [6] After the entire film reel has been exposed, scroll the film back into the cartridge and download the camera. The introduction of the OM-2 battery(s) requires two 1.5 V silver oxide batteries as a power source for both manual lens exposure measurement and automatic exposure control. Batteries must be inserted correctly or the camera will not work. [1] Remove the battery chamber cover by turning it counterclockwise with a coin. [2] Insert two 1.5 V silver oxide batteries (Eveready or UCAR S-760equivalent) into the battery chamber, making sure that each positive part (+) is outward-facing, as shown in the diagram inside the camera. [3] Replace the cover by turning it clockwise until it is tight. NEW UPLOAD by Mr. Rick Oleson on a solution to the battery problem: ... Olympus OM2S, OM3 and OM4 are great rooms... but they're also notorious battery eaters Here's a way to run the camera on a pair of AA penlight cells.... * IMPORTANT: If you press the trigger button when the batteries are fully discharged or when there are no batteries in the camera, the mirror will lock-up and the camera won't work. If this happens, follow the RESET procedure to unlock the mirror and make the camera operational before charging new batteries. * Reset procedure * If the mirror is up and the shutter is locked, press the RESET button in the lower left corner of the body holder and rotate the shutter speed ring manually until the reset mark (*) is aligned with the red triangle on the lens holder. Then the mirror comes down, and the shutter is unlocked. Check the battery status To check the batteries, move the selection lever to the CHECK position. The battery check lamp indicates the battery status in three stages, following: (1) The red lamp lights up strongly - Battery voltage is sufficient. (2) The red lamp flashes and goes out - The batteries are very weak. Fresh batteries are recommended. (3) The lamp does not light up - Batteries are emptied. Replace them. Battery problems: * Silver oxide batteries should last about a year under normal conditions of use. When the batteries are exhausted, the mirror will lock and the camera will stop working (repeat the above-mentioned reset procedure to unlock the mirror when charged with a new battery pack). When you go on a trip, it's a good idea to make a set of fresh batteries: * Continue when the batteries are weak (the battery check lamp flashes) will eventually lead to the mirror locking. Always replace weak batteries before extended photo-taking sessions. If two batteries are in contact with each other when unpacked, there is a danger of short circuit. To avoid short-circuiting, separate packaged in plastics supplied. They can be stored in the pocket at the top of the front cover of the hard housing. * Even when the batteries are relatively fresh, the battery check lamp will flash at low temperatures due to battery inactivity. These batteries often return to a higher power because they heat up at normal temperature. Check batteries often in low temperature conditions to make sure they are working correctly. | previous | Next | 1/9 | Back | to the index page of the OM2(n) instruction manual | Back | to the index page of OM2(n) | Back | at THE index home page of OM1(n) & OM2(n) Olympus OM-2(n): Camera Operations (9 parts) | Other Issues (5 Parts) Specifications: HTML | PDF (48k) Main reference map: HTML | PDF (203k) Olympus OM-2 SP: Camera Operations | Other details: HTML | PDF | Main reference map: HTML | PDF Olympus OM-1(n): Camera Operations (6 Parts) | Other Issues (5 Parts) Specifications: HTML | PDF | Main reference map: HTML | PDF (217k) Shared Resources: Additional Articles: TTL Metering, Depth of Field, Shutter Speed & Aperture Motor Drive and Power Winder: Main Index Page (4 Parts) Motor Drive 1 | Engine Drive 2 | Winder 1 | Winder 2 Flash Photography: Main Index Page (4 Parts) T45 | T32 | T20 | F280 | S20 | QuicK AUTO 310 | QA300, 200, 200S Macro-Photography: Main Page Index (3 Parts) Macro Flash Units: T10 Flash Ring, T28 Twin, T28 Single, T8 Flash Ring Accessories: Databack 1-4 | Screens | Accessory Finder | Remote | Zuiko Lens Cases: BACK!! | Message Pane | for preferred olympus OM-1(n) and OM-2(n) models in the SLR Camera series | Message Pane | for Zuiko Optics in a common environment | Message Pane | Specially for Dispose or Looking for OM Photographic Equipment Home - Photography in Malaysia Copyright © 2000. © leofoo.
