Philips zoom nite white 16 uk instructions

The 16% teeth whitening gel from Nite White and Philips effectively whitens teeth while providing maximum relief from hypersensitivity. The new HealthyWhite Triple Action formula offers improved enamel protection and improved mint flavor while maintaining the consistent whitening aspects of the current ACP formula. The 16% Nite White teeth whitening gel is considered medium driven and can be worn overnight or for up to 4-6 hours a day. Instructions Remove the plastic cap from the syringe and turn the mixing tip into place. Place a small amount of whitening gel in trays. Do not overload the hills. Place trays in your mouth and remove excess gel from the gums. Use trays overnight or for 4-6 hours. Remove the trays and rinse with cold water. Contains three 2.4 ml syringes (enough for 9 applications)Dual-Barrel Syringe TechnologyWhy a double-barrel design? The exclusive double barrel technology used for each syringe keeps the ingredients separate to keep them at maximum strength for an extended period of time. This also means that the syringes do not require cooling. How are the two spray chambers mixed? The auto-mixing nozzle that comes with it and easily screws on, each syringe thoroughly combines and mixes the two separate barrels to create a very effective teeth whitening mixture. Why the new Philips Zoom packaging? Nite White owes his sleek new look to Philips, the new owner of Discus Dental, manufacturer of Zoom! Nite White teeth whitening systems. With regard to the whitening products: products: these items are brought to you by professional dentists, always check with your dentist and doctor before any dental treatment. Do not use these items in place or substitute for dental treatment. Crowns, caps, fillings, dentures, cavities or bridges will not bleach or change color. Also, do not use such products if you are pregnant, nursing or wearing braces. If swelling of the gums, pain, or other questionable symptoms occurs during use, stop immediately and see your dentist. All teeth won't whiten the same. Grayish and brownish teeth will not whiten as well as yellow-hued teeth. Do not freeze the gels. Shipping estimates are based on domestic shipping (U.S.) - international prices will vary. Product information on this website is believed to be correct but is not guaranteed. Prices are subject to change without notice. Product packaging is subject to change without notice. Images of the product and/or product packaging displayed online may differ from the actual product being delivered. When available, newer versions of products can be replaced by older versions without notice. Important disclaimers: Please read before using teeth whitening bleaching gel. These are general recommendations and may vary from manufacturer to manufacturer. Please read the manufacturer's instructions and use this as a friendly guide in addition to the manufacturer's instructions. Dental Work: Teeth whitening (bleaching) gel will only whiten natural teeth. It will NOT bleach (pale) or damage bonding, caps, crowns, bridges, fillings, or other artificial dental work. You may need to have your dentistry done to fit your new white teeth. Tetracycline (an antibiotic) coloured teeth or greyish teeth are more difficult to whiten and have a varied prognosis. The exposed root part of the teeth that occurs with gum recession will also not bleach. If you have amalgam (silver) fillings in, near or behind the front teeth, long-term bleaching can cause the surrounding tooth to have a greenish tinge. Bleaching teeth that are see-through can cause teeth to become even more translucent and can give the tooth a darker appearance. It is important to consult a dentist if you have any of the above concerns. Sensitivity: Your teeth or gums are likely to become sensitive. It is common while using all products containing peroxide-based gels and it is not harmful. In case of increased sensitivity, reduce the time or frequency of use until sensitivity decreases. Due to the high incidence of sensitivity, dentist.net recommend routine use of Dr. Collins BioMin Restore Toothpaste before and after use of bleaching products. Warnings: Keep bleaching gel out of reach of children. DO NOT use if you are pregnant or breast-feeding. Do not smoke, drink or eat while you are bleaching your teeth. Product durability: TEETH WHITENING GEL KEEP FOR LONG-TERM STORAGE. The durability is one year un-refrigerated and two years refrigerated (Nite White and Day White have a 2 year un-chilled shelf life.) Please read the manufacturer's instructions and use this as a friendly guide in addition to the manufacturer's instructions. For more answers to common whitening questions, click here. Visit our sensitive teeth section for more on tooth sensitivity. PRE-bleaching instructions to minimize sensitivity two weeks before bleaching, brush your teeth regularly with a desensitising toothpaste like Dr. Collins BioMin Restore Toothpaste. After brushing for a few days, carry your empty bleaching trays alone for a few hours or even overnight. After wearing the empty trays, fill them with Relief ACP Desensitize Gel for 1 hour before bleaching. Alternatively, dentists also recommend placing desensitising toothpaste as BioMin Restore in the tray. Once you've got used to having the trays in your mouth, remove any desensitising toothpaste or gel before putting the bleaching material in the tray. DO NOT mix bleaching material and desensitising material. Please see bleaching instructions: It is important that you apply teeth whitening gel properly so as not to spill any of the gel and so that you experience the least amount of sensitivity while using the gel. 1. Immediately before treatment: Brush and floss just before bleaching your teeth. Whitening products are most effective with clean teeth. Try the hills at first without any bleach to check fit and comfort. Make sure the bleaching trays are clean and dry before using the bleaching gel. Moisture reduces the efficiency of whitening gel and slows down whitening process. 2. Applying the bleach gel: When applying the gel, be sure not to fill the trays. Place a small drop of teeth whitening gel halfway inside the front of the tray. DO NOT spread the bleach around. It just has to be in front of every tooth in the tray. Tame the syringe for the next treatment until it is empty. The average treatment per bow requires approximately 0.5ml of whitening gel. We recommend that you only whiten the front 6-8 teeth as no one sees the back teeth. 3. Insert the bleaching trays: Place the bleaching tray in your mouth above your teeth. Fasten the tray to your teeth. Wipe excess gel that seeps on your gums with your finger or with a tissue. Use the tray with the gel as instructed below. 4. Wearing Time: We recommend that if you have not used whitening products before, use for 30 minutes to 1 hour the first time. You can increase the carrying time if there is little or no dental sensitivity. General manufacturers recommended carrying times are: For Carbamid peroxide bleaching Gels: 10%, 15% or 16% strength can be used 2 to 4 hours once or twice a day. You can keep it for the night while you sleep if you do not experience greater after the first applications. 20-22% bleaching gel: use for 30 minutes to 1 hour once or twice a day. DO NOT exceed 1 hour/application. For hydrogen peroxide Bleaching Gels: Day White and Dentist.net Hydrogen Peroxide Bleaching gel can only be used for 30 minutes to 1 hour. 5. After whitening: Remove the tray and rinse your teeth. Brush away any remaining gel. Brush, floss, and continue routine dental cleaning. Apply desensitising gel and use BioMin Restore if your teeth become too sensitive. Repeat steps 1 through 4 again using desensitizing gel. Clean the whitening trays with a toothbrush or Q tip and cold water. Store the tray holder and gel in a cool and dry place away from warm and direct sunlight. The gel can be cooled to extend shelf life, but does not freeze. DENTAL WHITENING GEL SHOULD BE REFRIGERATED FOR LONG-TERM STORAGE. Durability is typically one year un-chilled and two years refrigerated (Nite White and Day White have a 2 year uncooled shelf life.) Please read the manufacturer's instructions and use this as a friendly guide in addition to the manufacturer's instructions. Additional notes: On average, the desired level of whitening results is achieved after 20-30 cumulative sessions of wear time. Continue brushing your teeth with Dr. Collins BioMin Restore Toothpaste in between bleaching. Longer wear times create faster whitening results, but can also result in more sensitivity without the correct precautions being followed. Faster results can be achieved with higher concentrations of carbamidperoxide or hydrogen peroxide, but can also result in more sensitivity without the correct precautions being followed. 50% of bleaching takes place in the first 1-2 hours. We strongly recommend that you whiten the top teeth first (one

tray at a time) and use a low strength percentage of bleaching gel. Use 10% carbamide peroxide (CP) to start. Repeat the cycle daily. If you do not experience any significant sensitivity problems, you can replace 10% CP with a higher concentration to possibly shorten bleaching time. If you have sensitivity after bleaching, do any of the following: Skip a night/day or two of bleaching, and start over. Start with 30 minutes and increase the carrying time if you experience any sensitivity. Most effective is placing Relief ACP Desensitizing Gel or Dr. Collins BioMin Restore Toothpaste inside the tray after bleaching. DO NOT mix desensitising material with bleaching gel. Use alternative uses of the tray. Use desensitizing material before and after the use of bleaching products. Products.
