Compus is a simple compass app to find your direction on the go. A clean compass in your pocket, although too simplistic. While each iPhone comes equipped with a standard compass app, its accuracy is far from ideal. Compus is an alternative iOS compass app. It uses your phone's magnetometer to determine its real-time direction relative to earth's magnetic field. The app is very simplistic, to the end of being quite bare bones. With no options to talk about or settings to match, Compus is as basic as a compass gets. You can see your current coordinates and your main direction. You can also set the angle your current direction creates with the true north. The angle is reflected in the standard No other angular units are offered. Compus is free to download, supported by ads that violate the compass every few minutes. Adding insult to injury, many don't have an 'exit' button visible. These leave you no choice but to exit the app or click on the being. Where can you run this program? Compus should run smoothly on any iOS 7 device (or newer versions) equipped with a magnetometer. It is also compatible with retical monitors on the iPhone 4. Is there a better alternative? Yes. If you need a richer compass application to feature, you have Altimeter GPS Pro, which also measures height and other variables. For a simple compass for navigation, Commander Compass has super-useful map covers. Compus isn't the worst compass app you can find, but it's more limited than most compass apps on the market. It's hardly an improvement on a built-in iPhone compass app. Although useful when pinching, the user experience surrounding awareness is very frustrating. Do you need to take it off? Not. Compus lacks special options or features, while ads disrupt normal usage. The built-in compass is that there will be enough even if it is. Launched during Apple's September 2020 event, it was followed soon after by the release of a whole new range of iPhones. But even if the new iPhones stole its thunder somewhat, the iOS 14 is still a huge deal for iPhone lovers. Why? Apple's latest mobile operating system showcases some of the long-awaited features, including home screen widgets, cycling instructions, and - the most shocking addition to date - an app drawer so you don't have to keep your apps on the home screen. Make no mistake - iOS 14 is one of the biggest new software advertiser of 2020. But talking is cheap. How can you say that? Here's how to download iOS 14 for your iPhone. However, you can still follow the final step to make sure your iPhone has the latest upgrades. Come back before you start if you have the right iPhone at hand, so you're good to start downloading iOS 14. As a stable release, it's less of a risk than lowering beta construction. But still, make sure you backed up your data, just in case the worst happens. Backing up using Apple's own iCloud iCloud is definitely the easiest way to back up your iPhone. Here's how: Connect to a Wi-Fi network. Go to the Settings app, select your name and tap iCloud. If you're in iOS 10.2 or earlier, you'll need to scroll down to tap iCloud. Here's how: Connect your iPhone or iPod Touch to your Mac, and make sure it's up to date. Follow on screen To enter the device passcode, or select Trust this computer. Open the Finder app and select the iPhone from the sidebar. Click the General tab, and then click Back Now to back up manually. Select your iPhone or iPod Touch on iTunes. Click Back Up Now to save your data. Download and install iOS 14 Andy Boxall / Digital Trends After you finish backing up your phone, you are ready to start installing iOS 14. Fortunately, that's probably the easiest part. Go to Settings & General & Software and let the system check for an available update. If it's available, tap Download and install and wait for the file to download. If it's not there, make sure you're using a compatible iPhone, or just wait a little longer - the update won't be released everywhere at the same time, so maybe it hasn't reached your area yet. Once the update is downloaded and prepared, you'll need to confirm that you want to update, and once your phone restarts again, you can use iOS 14. Editors' Recommendations
