Run time error 462

Runtime error 462 occurs in Visual Basic and Microsoft Access when we try to access word documents. The main cause of this error is that the file path to an object outside the burner code is incorrect. You can easily resolve it because the error message indicates that the remote server machine (the server you are in in your program to communicate). Does not exist or is not available. If you want to access files that are in other locations, then it is mandatory for you to provide the correct path/address/location, otherwise it will not find the address, and in this situation you will get a runtime error 462. In Visual Basic, it is not possible to create an instance of a class unless the class is clearly visible by exposing it as a COM component. If the server name is incorrect, you will receive runtime error 462. Cause of runtime error 462:- It is very easy to know the cause of runtime error 462. In Visual Basic, we use a function that is named CreateObject to create an object on the remote computer. For this, we write the remote computer name, which acts as the server in the argument of the CreateObject function. If the server name is incorrect, it will give you runtime error 462. Fix 462 Runtime Errors: - Can you resolve runtime error 462 by verifying the server name correctly? Typically, the server name is missing and this problem occurs. Supposing you want to access an Excel worksheet and save the worksheet in a file, it is compulsory that Excel must be installed in the system, and must also add a reference to the library from the COM tab. The name of the type library will vary depending on the version of Excel or the word. : Delayed Auction: Dim Smthg is an object or implicit reference: Dim Smthg is a range instead of Dim Smthg as Excel.Range or Dim Smthg as Word.Range, so you must fully qualify all the variables you set (I have done in your code). The second problem you work with multiple instances. Word and you need only one to manage multiple documents. So, instead of rebuilding every time with: Set WordApp = CreateObject(Word.Application), you can get an open instance (if any) or create an instance with that code: When an error occurs per the next WordApp = GetObject(GetObject). You can use this instance until the proc ends and before the end. Here is your code that checks and cleans, let's see: Dim WordApp subdocument as Word.Application Dim WordDoc as Word.Document 'control if there are folders exist. If Len(Dir(Dir(F:\documents\ & Year), vbDirectory)) is = 0, then MkDir F:\documents\ & Year(date) ' Get or create a word The instance when the error occurs, per the next batch of WordApp = GetObject(, Word.Application). Sheet (sample sheet) range(A1:C33) Copy with WordApp visible = Real Enable WordDoc=Documents.Add selection.pastespecial link:=false, data type:=wdPasteRTF, _ Deployment:=wdInLine, DisplayAsIcon:=False End with Application Wait (now + TimeValue(0:00:02)) CutCopyMode = False End Point with PageDocup.TopMargin = WordApp.centimetersToPoints(1.4) PageSetup.LeftMargin = WordApp.centimetersToPoints(1.5) PageSetup.BottomMargin = WordApp.CentimetersToPoints(1.5) SaveAs F:\documents\ & SaveAs Year(Date) & \Sample Name & Format(now YYYYMMDD) & .docx End with ' Export Sheet 2 to Word workbook (exampleworkbook.xlsm) sheet (sheet 2 example) Range(A1:C33) Copy WordDoc=WordApp.documents.add WordApp.selection.pasteSpecial Link:False, DataType:=wdPasteRTF, _Positioning:=wdInLine, DisplayAsIcon:=Fake Application Wait (now + time value(0:00:02)) with WordDoc PageSetup.LeftMargin = WordApp.centimetersToPoints(1.5) PageSetup.Top Margin = WordApp.centimetersToPoints(1.4) PageSetup.BottomMargin = WordApp.CentimetersToPoints(1.5) SaveAs F:\files\ & Year(Date) & SaveAs F:\files\ & Year(Date) & SaveAs F:\files\ & Year(Date) & SaveAs F:\files\ & Year(Date) & SaveAs F:\files\ & Year(Date) & SaveAs F:\files\ & Year(Date) & .docx; End with Application.CutCopyMode = WordApp fake out of worddoc set = nothing set WordApp = nothing ' Outlook dim objOutlook variable is Outlook.Application DimjMail as DimItem Dim rngTo Excel as Excel.rngDr. rngAttach1 is Excel.range dimming numsend to integer when the next batch error occurs objOutlook =GetObject(, Outlook.application). Set rngSubject = Range(B13) Range(B14) Range(B15) Through = rngTo.Value Subject = rngSubject.value CC =rngCc.value ' body = rngBody.Value Body = Hello & _ vbNewLine & vbNewLine & _ rngNewLine & _ rngBody.Value & _ vbNewLine & Attachments add rngAttach1.value attachmentsAdd rngAttach2.value display application.Wait (now + TimeValue(0:00:01)) SendKeys application %s ' Send ' instead of Show, you can use Send to send email _ or save to save a copy in the draft folder ending with numSend = 1. GoTo skipError handleError: numErr = numErr + 1 oFile.WriteLine *** ERROR *** Email for Account & Broker & Not Sent Error: & Err.number & & Err.Description skipError: When GoTo error 0 MsgBox send email: & numSend & vbNewLine & Number of errors: & numErr, vbOKOnly + vbInformation, GoTo endProgram completion operation cancels program: MsgBox No mailings, vbOKOnly + vbExclamation, The operation was canceled endProgram: set objOutlook = nothing set objMail = nothing set rngTo = nothing set rngSubject = nothing set rngAttach1 = nothing set rngAttach2 = nothing ends Sub It is good practice (for several reasons) to destroy the created object (if you do not want it) and because you say that the first run is no problem, I believe it may help in your case. Before sub end after you clear clipboard, enter this: Set wdApp = Nothing set wdDoc = nothing see if it helps? It's a good practice (for many reasons) to destroy an object created (if you don't want anymore), and because you say that the first run is no problem, I believe it may help in your case. Before sub end after you clear clipboard, enter this: Set wdApp = Nothing set wdDoc = nothing see if it helps? Thanks for the tip Bobsan, I included those two lines in the VBA code, unfortunately it didn't make any difference, sincerely Steve, I made a code change that seemed to fix this problem. In the original code, many of the first lines are ... Sub Excel_to_Word5() Dim wdApp is the new Word, the application Dim wdDoc is Word.Document, dimming myTable as dim table as dim string i as i integer = 1 set wdApp = New Word.Application ' force new Word application every time. Error Prevention 462 Set wdDoc =wdApp.Documents.Add Application.CutCopyMode = False 'Clear Clipboard with Visible = Actual ' Set Word document layout with wdDoc PageSetup.Orientation = 1 'wdOrientLandscape. InchesToPoints(0.5) PageSetup.TopMargin =InchesToPoints(0.5) PageSetup.BottomMargin =InchesToPoints(0.5)... Excel_to_Word5() dim wdApp is a new word, the application dim wddoc is. Dim myTable as dim table as dim string i as integer i = 1 Set wdApp = New Word.Application ' Force new Word application every time Error Prevention 462 Set wdDoc =wdApp.Documents.Add Application.CutCopyMode = False 'Clear Clipboard wdApp.Visible = True ' Set Word Document Layout [COLOR=#0000ff] with wdDoc [/COLOR] [#0000ff COLOR] PageSetup.Orientation = 1 'wdOrientLandscape[/COLOR] [Color=#0000ff] #0000ff . PageSetup.RightMargin = wdApp.InchesToPoints(0.5)[/COLOR] [COLOR=#0000ff] . PageSetup #0000ff.BottomMargin = wdApp.InchesToPoints(0.5)[/COLOR] .... To sum up, I deleted it with ending with wdApp command using wdApp clearly part of ... ending with the wdDoc command ... as I highlighted in the blue text above Last edit: Feb 10, 2019 2019
