Surround Sound describes the method of channeling sound that envelops the user in a 360-degree arc that places sound sources exactly relative to the user. This is especially useful in multiplayer first person shooters, where correct audio placement can help you identify friends, enemies and situations in the environment. Audio devices provide two types of surround sound: Discreet or virtual. Use multiple speakers in one system or multiple audio drivers in each earcup on the headset, positioned at different angles, discreet Audio lets players hear sound in realistic 3-dimensions, as they would in real life. Subtle surround sound provides immersive gameplay as it accurately represents how your character perceives the sound in the game world. See Razer Tiamat 7.1 Virtual surround sound can be found primarily in headphones that use only two drivers and complex sound processing algorithms to simulate the effect of having multiple audio drivers. These headsets use internal or external amplifiers and software engines to divide surround sound into different, separate segments and effectively reproduce a surround sound spectrum with only 2 drivers.
