The carnivorous carnival quiz

Where is the word "forensic" or "Forensic" comes from Latin forensis, which means "of or before the forum." It is also often interpreted as a public debate or belonging to a debate or discussion—leftovers from ancient Roman times (see chapter "Historical medicine"). Is there a difference between "forensics" and "forensic science"? There is a difference between the terms of forensic science and forensic science in the use of modern technology. The term "forensic" is basically synonymous with "legal" or "court"; In addition, the word is closely related to the pool of science. Therefore, terms are also in some vocabulary commonly used among themselves. Is forensic science just law enforcement and criminal cases? No, not all forensic science is about law enforcement and the prosecution of criminal cases. There is no doubt that certain media outlets have been spreading these ideas for more than a century; from books and magazine articles to modern TELEVISION and movies. And while many advances in forensic science have benefited from forensic methods and analyses, it also relates to civil and legal matters and to determining why certain non-criminal events and activities occur (such as transport-related accidents). Why is law considered multidisciplinary? Forensic science is multidisciplinary because there is no single science that answers all forensic questions, especially in the collection and analysis of evidence. Forensic scientists and experts from many disciplines are needed to solve the forensic dilemma; from biology (e.g. autopsy) to accounting (e.g. in a white collar crime case). In fact, according to the American Academy of Forensic Science, "There is literally no end to the number of disciplines that come "forensic" by definition." And in the future they predict that there will be even more specialties that will become part of the term "forensic." What some disciplines will be used in forensic science? There is a long list of scientific disciplines that are used in forensic science. Examples include biology, geology, pathology, genetics, chemistry, cryptology, psychology and ballistics. And these examples often have subfields. For example, in chemistry, a person can be an expert in analyzing drugs and toxins, while another person can be an expert in analyzing paints, tools and other physical objects. What are some of the scientific fields that are "nonforensic"? Although many of the methods and techniques used in forensic science come from different disciplines, there are some sciences that are not. For example, the term "forensic astronomy" has often been used to describe people who use astronomy to define ancient constellations. But it is not widely recognised or needed other disciplines of forensic science. Why are the various aspects of forensic science often necessary for crime and accidents? There are a number of causes of various medical diseases, particularly with regard to crime and accidents. For example, there are often no witnesses to a crime scene or accident; and if there are such witnesses, many people are unreliable when it comes to giving evidence. This is usually because people can like a particular part of a crime or a person who commits a crime, or they are subjective in what they witness. Another reason for the need for forensic science is historical—it can often be used to solve "cold cases" that occurred years earlier. Why is scientific evidence the best tool in forensic science? Since forensic methods and analyses derive from " cannot be "lie," results are usually

objective and objective—unlike many eyewitnesses™ interpretations of events. In most cases, this makes forensic science the best tool for resolving criminal, civil or other legal matters.
