## Tesla master of lightning worksheet answers

Who is Tesla? What did he do so wonderfully to deserve the school word named after him? Nikola Tesla, 37, Nikola Tesla (1856-1943) was a Serbian-American engineer and invented, known for designing and promoting the use of engines, substsers and rotating power distribution systems (AC). He had a long-running feud with Thomas Edison, who clings to the false belief in the superiority of direct current (DC) systems. Tesla finally prevailed. Tesla's work and invention spills into many areas, including X-ray experiments, radio transmissions, weapons, and aircraft design. An unusually mad scientist character who has never married, he has a photographic memory, a pathological fear of germs and pearls, and lives almost his entire adult life in a New York hotel. He died without a penny and his work fell into relative obscurity after his death, but in 1960, the General Assembly for Weight and Measure voted to honor him by choosing Tesla as the official unit for the power of the field. Try It Free Main Blog &gt; Neatorama Spotlight &gt; Tesla: Master of Lightning Alex Santos • Thursday, March 4, 2010 at 7:27pm • 9 In most advances in electrical engineering, as well as radio, we can follow the spark of thinking back to Nikola Tesla – Ernst F. W. AlexandersonTesla with one Published on the cover of Electric Experimenter in 1919.Few invented more contributions to advances in science and engineering in the early 20th century than Nikola Tesla. As one of the fathers of electricity, Tesla has done groundbreaking work on rotational electrical systems (AC), electrolyses, hydropower, radios, and radar to name a few. Many of his inventions (Tesla obtained about 300 patents in his lifetime) became things we take for granted today: when we flipped a switch to turn on the lights, we owed a lot of electric magic so fate Tesla.As would have it, Tesla, one of the world's greatest invented , dead without a penny and in the dark. Even today, many people confuse their many invented attributes to others (Edison, for example, is in the names of many electricity companies in the United States – ironically, they use Tesla's indused AC system rather than the less efficient direct current or DC system endorsed by Thomas Edison; Tesla also invented the fundamentals of radio before Guglielmo Marconi). Today, there is quite a lot of revival in Tesla's popularity, helped in part by his mystery as a mad scientist. Among its more bizarre ideas, Tesla has been working on death beams to remove enemy planes from the sky, pocket-sized resonates that can topple buildings, how to send electricity through the upper atmosphere, and areas of force to protect cities Etc. Tesla Company letter title. Note the words Wireless World phone transmitter. In their book, Tesla: Master of Lightning, authors Margaret Cheney and Robert Uth tell the story of the mysterious genius from being born in a small village in present-day Croatia, to his lonely death in a Hotel Room in New York. The book, years in the making, combines archives and hundreds of photographs, compiled from the Tesla Museum in Belgrade (previously insoreachable to Western writers during much of the Cold War), excerpts from Tesla's works, as well as interviews with people who knew the individual man , to draw detailed snapshots of Tesla's life and provide a clear explanation of his (often very technical) work. On a personal note, it has taken me far longer than I expected to write this excerpt for Neatorama Spotlight. Margaret and Robert's book was so fascinating that on many nights I ended up reading my late pass before bed. It seems that on every single page there are neat details about Tesla that are too good not to share! I highly recommend Tesla: Master of Lightning to anyone interested in learning more about the legendary Nikola Tesla.Excerpts from Tesla: Master of Lightning, by Margaret Cheney and Robert Uth: An Old World ChildhoodAs a young man, Tesla exhibits a distinctive characteristic that he considers the basis of all his inventions. He has an unusual ability, often inalocvately, to visualize scenes, people, and things so lively that sometimes he is unsure of what is real and what is imagined. Strong flickering light is often accompanied by these images. Tormented, he will move his hand in front of his eyes to determine whether the object is simply in his mind or outside. He initially considered the strange ability to be an anguish, but for an invention, it could be a gift. Tesla has written about these phenomena and his efforts to find an explanation for them, since no psychologist or a ermon can help him. The theory I built, he wrote much later, was that the images were the result of a reflex action from the brain on the retina under great stimulation. They are certainly not hallucinations because in other respects I am normal and composed. To come up with a my thoughts of suffering, assuming that I witnessed a funeral or some such nerve-wracking spectacle. Then surely, in the stillness of the night, a vivid image of the scene would push itself before my eyes and persist despite all my efforts to banish it. It, it will even remain fixed in space even though I pushed my hand through it. (Tesla, My Invention: My Original Life. Electrical laboratory machines; February 1919) Tesla in its Houston Street lab. The caption for this photo in Electrical Review, March 29, 1899 reads: The operator's body, in this experiment, is taken into account a high potential by a coil that responds to waves transmitted to it from a distant oscillation. Geniuses CollideOn on summer day in 1884 when Tesla, carefully wearing its bowler hat, striped pants, and cut-away coat (his entire wardrobe), dropped to see mr. Edison famous, there was an emergency at vanderbilt mansion on Fifth Avenue. Two ropes were cut short behind a metal wall and caused a fire. Ms. Vanderbilt herself extinguished the flames, only to learn that the problem a resulted from a steam engine and boiler in her basement. Now the angry socialite has been asked that Edison remove the whole machine. No sooner had he rushed back to Pearl Street than the manager of a shipping company called to report that the Oregon SS had been bound for days waiting for electrical repairs and had lost money by the hour. Unfortunately, Edison no longer engineers to assign to the job. At this point, he became aware of the tall foreign gentleman hovering politely at the doors, bowler hats in gloved hands, a letter in his pocket from Charles Batchelor, the British engineer who manages the Continental Edison Company in Europe. Few American colleges then train electrical engineers, so the outlook is good for rarely skilled immigrants. But Mr. Edison is not in a good mood. Tesla has spoken out, knowing that the famous man has hearing problems and introduced himself. He gave a brief message from Batchelor. Edison glanced a few lines and snored. I know two great men and you are one of them, Batchelor wrote. The other one is this young man! Thomas Edison, rumpled, tired, and deeply skeptical, asked Tesla what he could do. While the American invented only eight years older than his visitors, and lacked his formal education, he was world famous for his inventions. Tesla recalled their meeting: When I saw this wonderful man, who had not trained at all, had no advantage, and who did all himself, and saw the great results by virtue of his industry and application – you see, I studied a dozen languages ... and spent the best years of my life ruminating through the library. I thought to myself what a terrible thing it was wasting my life on useless things, and if I had just come to America right then and stay there and devote all my brain strength and created for my work, what can I not have done? (Tesla, My Invention: My Original Life. Electrical laboratory machines; February 1919)In Edison's amazement, Tesla conducts technical job description did in France and Germany, and talked about his plans for the ind touch engine to be made to run smoothly and powerfully on the rotating current. That invention, he argued, was worth a lot of assets. Edison knew little about alternating currents, chose to believe it was the work of the devil, and didn't care to learn more about it. Did this dandified Paris realize that he was suggesting could make an entire industry obsolete? In the past Edison has conducted a propaganda war against gas companies on the condition that the explosive ability makes gas too dangerous for humans to use as a source of energy. As a result, he has experience in recognizing and leading any threat to industrial competition. Tesla, un prepared for the force of Edison's passion, thanked him and turned to leave. As he did such a breathless boy rushed into the factory to report that a fork box at Pearl and Nassau streets had leaked power and had injured a carter and his horse. Edison bowed his head to plead guilty. Then he turned to Tesla and said, Wait a minute, sir. Can you repair a ship's lighting plant? So begins this historic collision of genius. It will eventually spark a bitter and prolonged Flow War, the flavour that still exists today in corporate memory. The lab where engineers TEsla and Westinghouse developed equipment for ac systems. Tesla's exhibition with Egg of Columbus, standing at the end when the table it rested on was slowly excited by AC. A smaller table with balls could be seen on the left; on the right, a high-frequency machine soon. The Executioner's CurrentIt is strange but true that the advent of electric chairs in america comes entirely out of a trade war over selling bulbs. Or, more precisely, on what kind of power supply will inst re-insten the nation's early light. Orders for Edison's lighting companies have fallen behind those for Westinghouse's newer AC systems. With progress marching right past him, Edison and his Wall Street investors opened a delayed campaign to block AC systems in any way possible, benefiting D.C. who came up with the idea that AC would fail if it was deemed deadly. A shadowy character associated with Edison, Harold P. Brown, has become a very public advocate of humanitarian deaths - caused on animals or humans - by AC. Dogs and horses are electrocuted brown in suspicious testing conditions. After Edison provided him with research facilities in the West Orange, New Jersey, lab, neighbors began complaining about the disappearance of domestic pets. Brown's efforts inspired New York State Prison officials to try the idea of a human being. A law was passed in New York (1887) to resent hanging in favor of electric shock as of January 1 1, 1889.Brown, predictably, has had a hand in supplying the machine to the state - a 2,000-volt Westinghouse generator bought old - since refusal to sell on approach. The first person to die by the new death penalty was William Kemmler, convicted of murdering his wife. He was executed at Auburn Prison, 6 August 1890. Some jolts were delivered, one in seventeen seconds and one for three and a half minutes. Witnesses said the victim's spinal cord caught fire violently. This method did not work very predictably, even until today. Several terms have been proposed for this new method of implementation, including thanelectrize, negative electricity, electrolyses, electric fields and fulmenvoltacuses. And why electric shock, also on the list, should have come to be preferred over electrocution is simply anyone's guess. However, the interest in D.C. electric current has created a point of saying that the victims of electric shock were Westinghoused. Tesla in a thoughtful position ahead of its web coil, May 1896.Lionized and Ionized (L) Mark Twain and Joseph (Jo) Jefferson in Tesla's South Fifth Avenue lab, 1894, with blurry images of TEsla between. (R) Mark Twain in Tesla's lab at 35 South Fifth Avenue, early in 1895Perhaps Tesla's most famous friend was writer Mark Twain, whose Serbian literary connections went back to childhood. In his autobiography, Tesla described how Twain helped him recover from a dangerous illness when he was given the first novels from his local public library and found them so charming that i completely forgot about my hopeless state. He suggested that the miraculous recovery followed by humor. Tesla claims that 25 years later, when he met Twain in New York, he told him the story of being touched and surprised to see the wonderful man of laughter burst into tears (Tesla, My Invention: My Later Efforts. Electrical laboratory machines; 1919)In Mark Twain's Handbook &amp; Journal, the author mentions reading about the sale to Westinghouse tesla's electric patent, which will revolutionize the entire world's electricity business. Twain made a bad investment - one of many - in developing a new DC engine, and was drawn to Tesla for answers. The answer is that this engine was returned obsolete by Tesla's AC polyphase. Because this seemed to be the occasion for their first encounter, Twain's tears may have had a more cash cause. On that basis, the two men became lifelong friends and, incidentally, fellow members of the Luxury Players Club. Twain was then instruments in encouraging Tesla to pursue its future weapons to shift the destruction of war from man to machine, after which it was naive to think that war would end when weapons became too terrible to contemplate. Mark Twain is one of those friends who is often invited to Tesla's lab for improvisational programs of fear and Like. On a special evening, it was Twain who accidentally offered entertainment when he when experiencing the gyrations of a platform mounted on an electrical oscillation. Tesla pretended to dissuad him, which of course made Twain even more eager to prolong the test. Once on the machine, he went on to say, More, Tesla, more! But soon he cried for help, since an undesirable effect of the oscilicity on the human body was to create a chaos in the intestines. When he was invited to the lab, a wiser Twain wrote: Friday, Midnight. Dear Mr. Tesla: I'm very sorry, but an inevitable business problem has invaded itself and bar me from going down... I'm very, very sorry. Forgive me. (Twain n.d.). Colorado Springs This publicity photo taken in Colorado Springs is a double exposure. Tesla poses with its magnimeter capable of producing millions of volts of electricity. The waste here is 22 feet long. In a patent filed years ago, the Electric Power Transmission System (No. 645576), [Tesla] claims it has become able to transmit through even moderately rare layers of atmospheric power to practically any amount and any distance. [...] A friend and patent attorney, Leonard E. Curtis, on being consulted on Tesla's scheme, offered to find land and power for his research from the El Paso Power Company of Colorado Springs [...] The lab that started rising from the meadow floor was both wired and strange, a contraption with a roof that rolled up to prevent it from catching fire, and a wooden tower that soared up to eighty feet. Above it is a 142-foot-long metal pole supporting a large copper ball. Inside the exotic wooden structure, technicians began assembling a giant Tesla coil. The frame on which the main coil weighs and 17 turns is a wound 51 feet in diameter. The third coil inside it is eight feet in diameter, with a hundred turns of wire. This giant air core machine can provide an electric current of 1,100 amperes. The more mysterious coil in the center exaggerates the electrical effects through a process called resonance. The function of this coil was not understood until the 1970s. Builders erect a high fence around the site, and signs appear on each post - KEEP OUT. GREAT DANGER - in the hope of keeping curiosity at a distance. Fritz Löwenstein couldn't resist posting at the door another sign, quoting Dante's Inferno: Give up hope, you all walk in here. [...] Image caption In Century Magazine, June 1900, read: The photo shows three ordinary incandescent lamps lit to provide full candle power caused by electrical currents in a local loop consisting of a single wire that forms a fifty-foot square on each side , consists of lights, and at a distance of one hundred feet from the main circuit is insynthetically inscened by oscillator. To check its theory, Tesla had to become the first man to perform affect the scale of lightning. Giant machines are arranged accordingly. On the evening of the experiment, he dressed for the occasion in a Prince Albert jacket, white gloves, and a derby hat. To avoid electric shock, he took precautions to wear shoes with a four-inch cork sole. One of his aides described him as looking like a gaunt Mephistopheles. Each item of the device, each wired and connected, has been carefully inspected. Tesla instructed its mechanic, Czito, to open the switch in just one second. The middle coil begins to sparkle and crack and an exotic blue corona is formed in the air around it. Satisfied with the result, he ordered Czito to close the switch until asked to terminate. Large loops of blue electricity snaked up and down the central coil. Explosive discharge can be heard outside (Cheney, Margaret. 1981. Tesla: Man out of time. New York: Prentice-Hall. Reprint, 1991. New York: Barnes & Noble Books)Bolts of artificial lightning more than a hundred feet long shoot out from the mast atop the station. Chaos can be heard in the mining town of Cripple Creek, 15 miles away. Tesla was thrilled to see the big fire bars. Then all of a sudden the lightning stopped. The test station turns black. He shouted at Czito to turn on the power again, but nothing happened. His experiment ignited a generator at the El Paso Power Company. Not just Tesla, but the whole city has lost power. The power plant manager was very alive and the locals began to have a second thought about the famous invented. But a week after the outage, both Tesla and the power plant returned to business. However, Tesla receives no more free power. A weapon to end the war (L) Postcard illustration of the New Yorker Hotel, New York City. (Collection of The New-York History Society) (R) Tesla unveiled its new beam weapon in multiple press interviews on its seventh and eighth birthday. This article is from The New York Times, July 11, 1934.In 1934 Tesla moved to its final residence, room 3327 (still divided by three) of the recently completed New Yorker hotel. There, he lived alone with his ideas and his pigeons for the next decade. He posted a numbered note on the door: Please do not disturb the occupants of this room. In Tesla's mind, it's time to reveal its greatest invention: a perfect and impossible idea, a weapon to stop World War II.On July 11, 1934, the headlines on the front page of the New York Times screamed, TESLA AT 78 BARES NEW DEATH-BEAM. The invention, the paper reported, sends concentrated beams of particles through free air, so enormous energy that they will bring down a fleet of 10,000 enemy aircraft at a distance of 250 miles from the border a protected nation and will cause armies of millions of people to drop dead in their tracks. When put into operation, Dr. Tesla said, this latest invention He will make war impossible. This dead beam, he insists, will surround each country like an invisible Chinese wall, which can only penetrate more than a million times. It will make every country invulnerable against aircraft attacks or by large invading armies. [...] Joseph Butler, a U.S. Air Force expert on beam weapons, said of Tesla's idea, Certainly, he had the concept of a nuclear-intensive beam weapon back in the 1930s. This concept was right on the mark... the particles projected out a long distance to do damage to some enemy aircraft, in his particular case. But Butler added, I don't have a clue how he meant to actually do it (interview with the author, 1998). Power transmission system for Tesla's aircraft via radio. Illustrated by Frank Paul for Radio News, December 1925.Enigmatic to the EndTesla's friend Kenneth Swezey also visited and was equally alarmed by his condition, especially when he found that Tesla was subsisting on warm milk and Nabisco biscuits. He noted that empty boxes of magnificent biscuits are stacked on shelves and used to hold different things. The news began to spread that the great invented was close to death. In late December 1942, when the war was at its peak, two young men identifying themselves as U.S. government agents suddenly entered Tesla's life. One is a member of the OSS (predecessor of the CIA) named Ralph Bergstresser. The other, Blyoce Fitzgerald, is a ballistic technology expert working with the Massachusetts Institute of Technology. According to Bergstresser, Tesla has agreed to share its most sensitive documents with them and allow them to carry stacks of materials away for micro-filming. Based on their assessment, the two men were able to arrange a meeting at the White House on January 8, 1943, with Roosevelt's scientific adviser and other senior officials. Tesla was too ill to attend (interview with the authors, 1993). Meanwhile, a prominent Soviet writer, Louis Adamic (The Immigrant's Return), wrote a letter to Eleanor Roosevelt on December 29 describing the invention's circumstances: Today he is... worse than not penny. He is extremely frail, weighing less than 90 pounds. His health was poor; he developed somewhat bitterness against his country, the United States ... He suffered, too, to the point of bitterness, because he felt that everyone in America, including the beneficiaries of property created by his inventions, had forgotten him. ... The reality now is that he is up against it... This letter is not an appeal to help him financially. ... This was merely to suggest that the President wrote him a letter that would show that America had not forgotten [him]. Perhaps this upcoming New Year is a good occasion for such a letter (Adamic New Year's Eve came and went, and there was no mail. Tesla's loyal partner, George Scherff, visited him on January 4 to help him prepare for an experiment. The last project, after all, the unknown nature, was terminated when Tesla complained of sharp pains in the chest. He refused medical aid. Scherff left the hotel, saying goodbye to him one last time. On the night of January 7, 1943, the night before Orthodox Christmas, snow fell over New York City. In a dark room on the 33rd floor of the New Yorker Hotel, Tesla lies listening to the noise of traffic below. His great legacy, the technological world he helped create, would have continued without him.

There will be no more riveting announcements, or shrieks of Eureka, or scary bolts of lightning jumping in his lab. The pigeons on the window ledge stirred their paws and ruffled their feathers. Difficult times lie ahead for pigeons; He had nothing left for them. Nikola Tesla, 86, died in his sleep. The coroner's report read: There are no suspicious circumstances. Cosmic Signature Nikola Tesla monument is installed at Goat Island, Niagara Falls, a gift to the United States on the bi-centenn year anniversary and 120th anniversary of Tesla, July 23, 1976. The monument is a second cast of sculptures by Fran Krsinic. The first casting is installed in front of the Faculty of Electrical Engineering Construction, University of Belgrade.The world will be a very different place without the ideas and inventions of Nikola Tesla. With the flick of a power switch of waterfalls and charcoal furnaces are transported to our fingertips. Worldwide communication approaches nearly everyone on the planet. A remote control device has explored the surface of Mars. And at this point, the recipient points to the heavens waiting for a remote message. One can imagine the invented nodding, then shrugging, and perhaps wondering what gave us so long. Finally, Tesla is one of our biggest dreamers, and great dreams have a way of becoming a reality. The invented comforts himself by saying, Scientific Man does not aim for an immediate result. He did not expect that his advanced ideas would be easily brought up. His work is like that of a grower - for the future. It is his duty to lay the foundations for those who will come, and show the way. (Tesla, My Invention: My Original Life. Electrical laboratory machines; February 1919)\_\_\_\_\_The is an excerpt from Tesla: Master of Lightning by Margaret Cheney and Robert Uth. It's copied here with permission. There are many parts of Tesla's life that we don't talk about - for example, the details of Flow Wars, his contributions to the Niagara Falls hydroelectric plant, his mysterious work at Wardenclyffe Tower - are illustrated in great detail in the book. ABOUT THE AUTHORSMARGARET CHENEY is the author of three previous books, including the classic biography Tesla: Man Out of Time that she received first international Tesla award. A former Associated Press editor, she is now a of the executive board of the Tesla Memorial Society. She lives in California.ROBERT UTH is a documentary producer and writer. With his wife, Simonida, he spent years researching the life of Nikola Tesla. This study is also reflected in his documentary Tesla: Master of Lightning.It's your request: log into your Neatorama account (this contest is open to subscribers of the blog. If you don't have one, please sign up - it's quick and easy!) and leave us a comment. One comment per user, please - we will choose a random one in a few days. I'd appreciate it if you would tweet about this article, follow us on Twitter or visit our Facebook Fan page. Thank you! Update 3/12/10 - Thank you guys! We chose the winner at random using the algorithm random.org. Congratulations to #67 Wendy who received the book.
