Layers of earth worksheet answers

How did Andrija Seorovic find that the Earth's crust is made of less compact stone than mantle. By studying earthquake waves. The waves move at difren's speed and at different angles through different layers. Write in your own words the definition of cessation. Cessation is the boundary between the layers of the Earth. Name four layers of earth to be from outside to the centre of Earth.1.Crust 2. Mantle 3. Core Outer 4. What Internal Core causes the mantle to flow? The mantle flows because of the circulation current caused by a very hot material in the rose mantle, cooling, and then sinking. This pattern of circulars causes the mantle to flow. What are the two main metals that make up the outer and internal core? Nickel and Iron Describe in your own words how the Earth's layers are formed. Card 2 the Four Layers will help you. When the Earth cools density, the heaviest ingredients sink into the middle of the Earth. The lightest ingredients increase upwards. This material is made mostly stone. Stones form the crust of the Earth. Compact stones form mantle. The most compact, iron and nickel materials, form the internal and external core. In your own words describe what expresses the Continental Drift Theory. Earth plates are moved slowly, 1-4 inches a year, with conveyor currents embedded from mantle. This plate has been moving for millions of years and continues to move today. How Alfred Wegener tried to prove that the African and South American continents were once connected. Alfred Wegener found that magnetic bands on the rocks from South America showed no north poles as he should. If these stones are moved to the position that Wegener even if they are created then they point the northern ots. He also matched rocks from Africa and South America for mineral and age content. How do ancient Japanese people explain the earthquake? Japan explained that the earthquake was produced by a giant catfish called Namazu. These catfish live below the surface of the Earth and shoot very violently when it is not controlled by the god Kashima. How the ancient Romans explained the volcano of presence. Vulcan, the god of arms, used a volcano off the coast of the Roman Empire as his fortress. What Discussion Question causes mountain buildings? Mountains are formed from the Earth's plate movement. When the plate crashes into each other they push a high crust into the mountain. What is the difference between how folding mountains and mountains of block faults are formed. Folded mountains shape into rollercoasters like formations. The layer is bending but not damaged. When the block's fault mountains formed a layer rejected and broken down into sharp peaks and high valleys. How dome mountains form? domes are formed when the Earth's layers do not break or fold pushed into the form of a round dome. In your own words describe what happens in the subduction zone. Two plates come together, one copes with the other in the subduction zone. Ocean plates, which are thinrest and compact, are driven under continental plate and into mantle. Deep ocean drains are produced in the quarrel zone. In your own words describe what happens in the mid-ocean ridge. Two plates separate with good magma and fill the void with a newly produced crust. These dispersed plates make the ocean wider and wider while the reconnaissance zone makes the ocean smaller and destroy the old crust. In what subdued zones causes magma to rise? The ocean crust and upper layer of mantle melt as it is driven into the mantle. The ocean crust is not compact because of the mantle. Because this material is less compact it will increase. Thank you for your participation! You can create printable and diluted tests from this Earth Layer question! Select one or more questions using the checkbox above each question. Then click add the selected question to the test button before moving to another page.
