One-shot case study pdf

a research model in which one group is perceived only once after it was assumed that a particular occurrence was an intermediary of change. The amount of scrutiny in this model is so minimal that most research methodists consider the model to be unscientific. ONE-SHOT CASE STUDY: One-shot case studies are often conducted after traumatic events where participants suffer a certain degree of survivor's guilt as a result of deceased persons. [engl. one-shot case study; one eins, shot Schuss], [FSE], Forschungsdesign, bei dem Beobachtungen an Einzelpersonen oder einer Gruppe gemacht werden, nachdem ein Ereignis vorgefallen ist oder eine Handlung durchgeführt wurde. Problematisch ist dabei, dass diese Beobachtungen mit nichts verglichen werden können (Fehlen einer Kontrollgruppe), sodass das Design keinen Aufschluss darüber gibt, ob das Ereignis bzw. die Handlung auch wirklich einen Effekt hatte. Daher sind One-Shot-Studien für die Prüfung von (Kausal-)Hypothesen (Evidenzbasierung, Kausalität) nicht aussagefähig. Fallstudie. Our members are the world's leading manufacturers of intelligence, analysis and insights defining the needs, attitudes and behaviors of consumers, organizations and their employees, students and citizens. With this basic understanding, leaders can make smart decisions and deploy confidence-building strategies and tactics, inspire innovation, realize the full potential of individuals and teams, and successfully create and promote products, services and ideas. A single-shot case study design is shown in Figure 4.1e. It is also called ex post facto design because one group of people is measured on some dependent variable after the intervention occurred. This is the most common research proposal in studies to change culture, where it is clearly impossible to manipulate a dependent variable. You come into the community and you notice that something important has happened. A clinic or school was built. You will try to evaluate the experiment by interviewing people (O) and impact assessment intervention (X). With neither the test nor the control group, you™ believe that what you are observing is the result of some particular intervention. However, despite this obvious weakness, the intuitive appeal of the findings made by single-speed case studies can be impressive. In the 1950s, doctors began the General Use Pap Test, a simple office procedure for determining the presence of cervical cancer. Figure 4.2 shows that since the 1950s, mortality from cervical cancer in the United States has steadily declined, from about 18 BOX 4.3 POSTTEST ONLY: UNDERATED DESIGN Posttest-only design, with random assignments, is not used as much as I think it should be, despite its elegance and its low cost. In June 2009, 1,110 examples of studies were discovered in the search for psychINFO, pretest-posttest design, compared to 133 for studies that use posttest-only design (with or without random assignment). This preference for classical design is partly due to the attractive but misconceived idea that comparing participants in experiments with key independent variables (age, ethnicity, etc.) is somehow better than random assignment of a participant to groups and partly to the nagging suspicion that preliminary tests are necessary for an experimental method. That nagging suspicion (that we can do better than believing the outcome of events on randomness) has focused a lot of research since a paper by Glöwlich et al. in 1985 titled: "Hot hand in basketball's misunderstanding of random sequences." The hot-handed phenomenon of the belief that stripes (in sports and in money management, for example) are the result of nonrandom forces is difficult to break. For the same reason, it is believed that small samples, if taken at random, are sufficient to justify generalisation to the population. On this, see 600+ quotes from Tversky and Kahneman (1971) and Chapters 6 and 7 on representative and unrepresentative sampling (Further reading: posttest-only design). Figure 4.1e. One-shot case study design. per 100 000 women to around 11 in 1970, to around 8.3 in 1980, to around 6.5 in 1995 and to around 2.4 in 2005. If you look only at the data after the intervention (one-shot case study X O design), you can easily conclude that intervention (Pap Test) was the only cause of this decrease in cervical cancer deaths. There is no doubt that the continued decline in cervical cancer deaths is largely due to early detection provided by the Pap Test, but by 1950, mortality had already fallen by 36% from 28 per 100,000 in 1930 (B. Williams 1978:16). Never use a design with less logical performance when one of the larger performances can be used. If pre-tested data is available, use it. On the other hand, a one-shot case study is often the best thing you can do. Virtually all ethnography falls into this category, and as I have said before, nothing surpasses a good story, well told (Further reading: methods of case study). Page 2 The pre-test posttest design of one group is shown in Figure 4.1f. Some variables (observed) are measured, then the intervention is carried out and then the variables are mea-FIGURE 4.1f. One-group pretest-posttest design. insured again. It takes care of some of the problems associated with one-shot case studies, but™ it eliminates threats of history, testing, maturation, selection, and mortality. Most importantly, if there is a significant difference in pretest and posttest measurements, we™ know if that difference has happened. Single-group pretest-posttest design is commonly used when evaluating educational programs. The question is: Were there people who were exposed to skill-building program (midwives, miners, kindergarten teachers, etc., etc.) to get some impact from the program? M. Peterson and Johnstone (1995) studied the effects on 43 female inmates from the U.S. Federal Prison Education Program on drug abuse. All participants have had drug abuse in the past, so there is no random task. Peterson and Johnstone measured participants™ health and perceived well-being before the program began and after the program was launched for 9 months. They found that physical process measures were improved for participants, such as self-esteem, health awareness, and health-promoting attitudes (Additional reading: one-group pretest-posttest design).
