Discord app stuck on voice connecting

Each app has its share of annoyances, but some are so popular that you're just stuck using them - either because your friends need it for a particular gadget, or just because there's no real alternative. Here are 10 popular apps that are nerve-angry, and what you can do to fix them.10. SkypeSkype isn't our favorite video chat app, but it's one of the most popular, which means if your friends and family use it, you're stuck using it from time to time, too. You can't fix Skype's bad interface, but you can at least fix its desire to always be in your face. Just go to settings and uncheck Play Skype when I start Windows under General, save Skype to the taskbar under Advanced, and turn off some of its notifications. At least keep it out of your way. SpotifySpotify is a fantastic service with a medium desktop app and a terrible mobile app that will back it up. If you want to take advantage of its music library, though, you have to deal with the apps. Again, you can't fix their interface, but you can stop Spotify from broadcasting your activity to everyone on Facebook, both on desktop apps and on your mobile device. You can also turn off Social Spotify. Finally, you can mute your ads if they get on your nerves, but as a website that supports ads, we recommend that you use those ads sparingly.8. YouTubeLike Spotify, YouTube is an amazing idea wrapped up on a site with more than a few anesthses. Some aren't exactly YouTube's fault (like the positive idiotic comments section), but others are baked right into the service (like videos that are automatically prevented. we've shared a number of extensions and scripts that are going to make YouTube a lot better, so with some changes here and there you're supposed to be good. 7. Twitter Twitter has become increasingly annoying over time. They follow you online, they limit third-party customers, pile on ads, and more. The official website and apps aren't very good these days, but if you want to be part of the network, you can make it a little nicer to use. First, make sure they stop following you all over the internet, and then try a new Twitter customer like one of our favorites. You can even return the Instagram previews, if you want. Re-mixed image from rudall30 (Shutterstock).6. JavaWhen asked you what your least favorite apps were, how many of you responded with Java, mainly because of its inside access to updates and security issues of its browser plugin. Fortunately, if you need Java in your system, both can be repaired quite easily. To avoid security problems, just turn off your browser plug-in. For these pesky update notifications, go to java settings to adjust how often it notifies you about new updates, as well as other scheduling features (though you must allow it to update automatically so that it stays as secure as possible).5. Anything related to the printer, you'd think it'd be easy to write. Printer assistant, but history dictates differently. If you're tired of your horrible, slow, and printer cart partner, help is on the way: Check out our guide to disqualify your Windows printer and scanner setting. When it's over, you'll have a printer that works fully without all the that comes with it. Photo by Kevin Cortoassi.4. iTunesMac users may not understand this pain – since iTunes is actually a reasonable program on OS X - but it may just be one of the most horrible apps available on Windows, mainly due to its unbearable slowness. Installing a better music program is always an option, but if you have iOS devices to sync, you're stuck with iTunes. Our recommendation? Import your library into another music app, and then use iTunes only to sync. It's a little more work, but you'll be glad you switched. Photo Credit.3. Adobe Flash, Flash. Nothing makes my laptop fans get out of hand and overheating quite like you. Nobody likes Flash, but we have to use it online almost every day. The best solution? Install an add-on like FlashBlock (or enable Chrome's Click-to-Run feature) to prevent Flash from at least running when you don't need it. It will white up any space that flash has in it, and you can click on it to activate it. If you really want to, you can also go on the some-to-sea-John-Gruber track of uninstalling completely and only using Chrome when you need Flash.2. Facebook Where do we even start? From topics in private to confusing interface elements and annoying people, Facebook is an app that we use and most of us hate. If you don't want to get out of Facebook, you have several options to make it better. Check out our persistent privacy guide as well as our guide to make Facebook idly good with a single browser extension. And when it comes to annoying people... Well, there are ways to paralyze them as well. Re-mixed image from Trekking and Fools (Shutterstock).1. Your operating system Sometimes, the most annoying app you have to deal with isn't even an app at all - it's your entire operating system. Whether it's on your phone or on your desktop, there's no perfect operating system, but we're stuck with what we have - and sometimes, you're stuck with something you don't even want (sorry, office workers). So what can you do? We've tweaked more manuals than we can count to tweak your operating system, but this is a good place to start. We also recommend that you perform the right maintenance for your software, whether it's Windows, OS X, Linux, iOS or Android. If you're angry about your phone, you can either jailbreak or root it out and get a lot more than that. Re-mixed image from Yuri Acors (Shutterstock). Controversy is new to the chat scene, but it made a big splash. The app provides voice chat and text to groups, with an emphasis on games. However, it's so sweet that I've already started using it for everyday conversation. If Ever used Slack, controversy will feel familiar. It builds on some ideas that Slack uses that people like like organized channels and built-in text commands, plus a simple, dead group voice chat. Of course, you don't have to play with it — I only use it to chat with a group of friends instead of something like Skype or Facebook Messenger — but it has some helpful features when playing games. Here is an overview of the core features Discord offers:There are apps for each large platform, plus the browser. Controversy is available on Windows, macOS, Android and iOS. If you don't want to install it, you can also use your Internet computer. All apps use the same design and features almost identical. The interface is amazing and simple. Some voice chat apps like Ventrilo sacrifice an intuitive interface for advanced features that aren't really necessary for most users. Controversy no. It has a slick design that even the most casual user can quickly pick up and understand. It can make a big difference when you're trying to get everyone together on game night. It's easy to set up a server. Setting up servers for Ventrilo and TeamSpeak is a pain. You must install the server software on your hardware and divide the server information into users before they can log on. With controversy, setting up a server is a matter of two clicks. The downside is that you can't run servers on your computer, so if Discord goes down so does your chat. If it doesn't matter to you, though, this method is much easier. You can also invite members to a server with a link that expires automatically after a short time. Text channels and voice chat give you the best of both worlds. The controversy comes with Slack-style text channels that users can jump in and out of, plus edom-style sound channels so different teams can play together on the same server. Most apps do only one of these two functions well but Discord handles both effortlessly. Dawdling on a text channel while you're chatting in group voice chat in the same app is a treat for anyone who's had to manage multiple IRC and Vent windows. It's free. As of this, controversy doesn't charge for anything. A help page on the site states that they plan to eventually charge for optional cosmetic items such as sticker packs, sound packs, skins and the like! Time will tell if this plan works, but for now the company is a start-up offering a free product that works really well. Equally use it too! More than anything, controversy resolves many small anesthses that makes other applications such a pain to use. You don't need to install an app if you don't want to. You can log on to a server with a link, instead of transferring complex server and password information. Plus, it just seems nicer than most alternatives. Setting up a server is just crazy and one of discord's absolute best features is how easy to set up new To demonstrate this, here's the whole process I had to go through to create a Lifehacker dispute server:Click this button..... And then it's... Then give him a name and end. That's it, that's it. There is no server software installed. Don't mess with outlets or exits. It took longer to take screenshots of the process than it did to create the server itself. After you set up the server, a large invite members button is available on the right side of the app. Click on it and controversy will create a self-destruct link you can use to add new members for the next half hour. You can also customize the invitation links to restrict who can sign in. You can change the work clock to expire anywhere from 30 minutes to the day after it is created (or never, if you prefer). It is also possible to limit the link to a certain number of uses, up to 100. If you just want to invite someone as a guest, you can give them an invitation that will automatically expire and reboot the user after they disconnect from the server the first time the sound channels are powerful and easy to use chat is the main event Discord and the app does it very well. When you first create your server, you will be on a default global channel. You can create as many channels as you need for different tasks. For example, on my gaming server I have a separate channel set up for Overwatch, World of Warcraft, plus AFK Channel. The dispute also gives server administrators a ton of useful management features:Create roles for different users to help manage your community: You can create custom roles for entire user groups. For example, you can create a management category for users who can kick or ban users, manage channels, and even silence other members. You can then create a lower Mods category for users who only have the ability to kick or ban unruly users. Server owners can even define different color schemes based on the permissions a user has. You can read more about controversial role management here. Set up automatic AFK channels: It's annoying when someone walks away from their computer and leaves their microphone running. Server administrators can set a default AFK channel where microphones are always muted. They can then automatically initialize inactive users to this channel if they are inactive for too long. Require authentication for new

users: Server administrators can require new users to meet certain authentication standards before they are allowed to send messages to people or use channels. The default is not authentication at all, but you can require users to have an e-mail address authenticated with Discord, and optionally require that they register with Discord or on the server for 5 or 10 minutes. These can be helpful in reducing spam or trolleys of harassing users. You can read more about authentication levels here. A dispute allows you to choose between push-to-speech modes or voice-activated modes for audio chat. If you select Voice Activated mode, you can Customize the volume level your app needs to detect before it transmits your voice. In my experience, it only took a few seconds to set up but it worked flawlessly afterwards. Text channels offer photo sharing, slash commands, and more. If you've ever used Slack or IRC for group chat, the controversy will feel pretty familiar. You can create and join channels in the [#channelname]. You can upload photos directly to Discord to share them with everyone on the channel and search for emoji directly next to the chat box. You can even use some slash commands like /me. Controversy doesn't have as many bells and whistles as Slack or the IRC, but the orders it has are amazing. Here are some of the biggest: giphy and riffsy: These two commands allow you to search a wide archive of animated GIFs to add directly to your chats. /ts: This command reads your next message aloud for the channel. It can be very helpful if your group is in voice chat in a game or other application and your microphone doesn't work. /tableflip, /unflip and /shrug: Sure, probably adding these emoticons to your text extender ages ago, but on the wrong chance that no, these commands are super helpful. Most slash commands are just for fun, but they help flesh out an already powerful chat app. The controversy is aimed primarily at voice chat, so it will be easy to neglect text-based channels. Fortunately, it's not. Discord combines the best elements of Skype, IRC and Slack for many years, the best way for computer gamers to get on group voice chats were either Ventrilo or TeamSpeak. Now, I'm afraid of the days of returning to these apps. Controversy does a lot of the same things with much less hassle and the added benefit of a powerful chat app built right in is easier to set up than Slack and more intuitive than Skype for Big Group Chats. Controversy isn't the perfect app for any situation. Her heavy focus on gaming means she may not have the advanced features that, for example, a business might need a conference call. However, if you've ever struggled with an annoying chat system when trying to get a group together for a chat on your computer, Discord is a breath of fresh air. Air.
