SuperSU requires a device derived from !!! SuperSU enables advanced superuser access management for all applications on your device that need rooting. SuperSU has been built from scratch to fix some issues with Superuser access management tools. Features include: - Superuser access logging- Per-app notification configuration- Temporary unroot- Deep process detection (no more unknowns)- Works when Android isn't properly booted- Works with non-standard shell locations- Always runs in ghost mode. System Application- Complete Backup scenario to survive CyanogenMod nighties- Icons can be selected from 5 options + invisible- Themes can be selected from 4 options- Launch from dialer: *#*#1234#*** or ***#7873778#* (***#SUPERSU#*****NOTE: Not all phones both codes. On some phones, you need to use one *# instead of doubling *#*#The Additional Pro version provides:- OTA survival mode (not guaranteed)- Full color-coded command content log (input/input/out/error)- Configure each app's logs - Each application user overrides- Grants / rejects root for an application for a certain period of time- PIN protection- Pin protection according to the application- Adjust the automatic countdownSUPERUSERThi this means to replace Superuser (if installed), you use one or the other. You can't combine them. The claim that this Superuser break is therefore complete nonsense. NOTE: A SPECIAL PROCEDURE IS NECESSARY TO UNINSTALL. IF YOU DON'T LIKE THE APP, DO *DON'T* JUST UNINSTALL IT, YOU*LL *LOSE ROOT. Superuser Access Management runs through a so-called binary su. There may be only one of these at a time. So if you install SuperSU, your previous superuser access management solution will no longer work. So if you want to switch back: (1) Open that application, and look for an option for it to install / update / replace su binary. (2) Confirm that applications that use root are using the superuser solution you want. (3) Uninstall SuperSU.IN-APP Muath this is completely optional and like donations. They do not unlock any functions.
