## Liquid glass polish shelf life

The Liquid Glass LG-100 may not have heard from many people, but it has been on the market for some time – since the early 1980s. It's a synthetic leak that doesn't contain any hesi. This product is known for its ability to mitigate the effects of the most common elements that destroy the appearance of the car. From the deterioration of road salt and the lya of birds to scratches, rust and corrosion – the final glow will cover anything. What's great about this car ending is that when it's air-healed, it hardens and becomes just as lustrouty and durable as the reinforced glass. Therefore, you will never have to deal with cracks, scratches, scales or colors of color. Buyers love the sustainability, splendour and general protection it offers to its vehicles, motorcycles and even boats and fire trucks. One mentioned that he used it on his plane, so imagine the extreme conditions that the plane goes through – you know that the Treadmable backs up it's to claim to leave a clear, hard and smooth mirror-like finish. More people were not happy, however, because instead of hiding the ossuaries, it was magnifying and making it more visible. Whether this product is right for your vehicle or not depends on how much you have an advantage in extended durability. Important Note: Before applying the wax or seal make sure you pre-access the paint, it gives you a clean surface for the wax or gasket to connect and this will increase the protection it gives, your car will also have a better glow. If you haven't read our guides on how to wash, clay and varnish, take the time to do it, it takes a little more effort, but it will ultimately be worth it. One of the great features of this product is durability, which you will not find in most car waxes on the market. Other features include: (Back to the Top) One of the most powerful L-100 apartments, tough enough to use on fire trucks and boats that will need better protection as they are subject to a narrower environment. In fact Liquid Glass claims that if you put on a 25 coat (yes! you can put on so much) it will be resistant to chips! Remember, it's a four-hour time to get better between coats. It provides a layer of protection against things like insects, snow, tar, dressing paint and salt, which can do some serious damage to the color. This has been mentioned several times in the review, one in particular mentioning that he protected his car from yellow overflating from people taking pictures on the roads. Ease of use (Back to top) Shake very well before applying, the instructions on the back state that you will need to use a steep cotton cloth and apply it from straight back and forth, it is interesting to know that you will need to apply it to a warm surface (50 – 90 degrees F) as indicated in the instructions – you can do so by using it under the sun. I'd rather may be the application of indoors. It also states that you can see some colour on the cloth – which will be the case if the colour of your vehicle is one stage or does not have a clear coat. However, this indicates that these seals also have some lightweight polishing/cleaning properties that can record light oxidation. Also, avoid using circular motion during the application process, as this can result in swirl marks as one consumer mentioned in its review. You can wipe and turn it off on a plate or apply it to the whole vehicle before buffing, it won't matter, which is important is that you need to bake under the sun for four (4) hours for this bond well on the paint. Do not apply any wax before placing this wax, as each wax will disrupt the binder process and damage the stability. Even if the color has some moderate to heavy oxidation, you may want to polish that off first before using this product. Ease of Removal Instructions states that you should use a terry cloth or Turkish towel, or you can also use a microfibre towel. You may see stripes on a darker color color, but this can be easily eliminated by wiping with a damp towel. Gloss (Back to Top) This product doesn't have many filling properties, as one consumer noticed, after it applied, it was more visible that the wheel was more visible. This should be applied to a clean surface without wax, if the colour has an old wax, a strong oxidised paint or a rotating label, you will need to address this with a good varnish before you put it on. Liquid Glass recommends using a pre-cleanser, but any quality varnish will do. Once done correctly, the result of the gloss will be worth all the effort, as has been inered with most reviews. Pro & Cons (Back to the Top) Pro This product has existed for decades with the fact that there are several ratings, mostly they are positive. Consumers love how this product provides excellent protection against watersles, insects, snow, salt, road tar, stains and other support elements. It's not wax on the wax off the product, which means you can apply the LG-100 to the whole vehicle first before it rests. Normally in about an hour you can finish the whole vehicle, just be careful not to over that as you can leave some debris after. Not only can you use this on color, but you can also use it on other non-porous surfaces, such as glass or windscreen, and do not obsess plastic parts. Cons As with most products with on the market there are still issues. A 4-hour time for treatment or baking may be for some too when you want to add more coat, but there are other products that should be cured for longer than 4 hours, so in our opinion a little patience can be rewarded with gleaming results after 2 or more coats. This can leave some streaking in some colors, such as red, but it can be easily solved by spraying some quick detail or water on when you delete. As with most products on the market, you can also notice the smell coming from this product, as expected from any product manufactured with chemicals and other synthetic ingredients. For medical reasons, wear a mask when working with this product. It can also be a little tricky to pour this product on your applicator because the way that the container is designed, one thing you can do is place an applicator pad or towel microlatter on top of the opening then turn upside down to get the product on the applicator. The use of the appropriate technique is critical, which means avoiding the use of circular movements, as this can lead to rotating marks, as one consumer has noted. Customer Reviews (Back to the Top) It's no surprise that the Liquid Glass LG-100 received the highest rating almost unanimously. One of the customers used it on a few classic cars worth more than \$100,000. On many occasions, we'd rather have that in meguiar's wax. It was specifically mentioned that a better shine and skating surface were made compared to products and liquid glass. I have a black BMW 740L. The previous owners didn't take great care of the paint. There were some clues on a few parts of the car. If I put this on a new vehicle, the Liquid Glass would be perfect, at least 4 stars... (Read more) Price (Back to top) Not cheap, but consider the goal and the protection you get without needing frequent reuse apps is great value for money in my opinion. You can have more savings because this product is eligible for FREE DELIVERY when you enroll in the Amazon Prime program. The finish (Back to The Top) isn't cheap, but you get a lot of mileage with each lemon of liquid glass LG-100, each coat will last for months. You can add multiple layers, just make sure you follow the recovery time of 4 hours. Use and removal is easy, so you won't have to wax the car for hours. During the operation of the car, microscopic scratches are formed unwaveringly on the paintings. This may be because of various factors - improper washing, bushes, small pebbles flying under the wheels of a vehicle passing by, etc. To maintain a familiar glow, cars are polished. Today, there are many tools in the car that can eliminate small prints or restore the freshness of color. Among them - originally a Japanese development, which was called liquid glass (sometimes autokeamika). Consider what this fluid is, what effect it has on the body of the car, how to work properly with it. Also pay attention to the pros and cons of the tool. What is liquid glass? Liquid glass is a flow-through agent containing various compounds of polymers of silicon dioxide, titanium and alumina, alkaline compounds of sodium and potassium and silicone. Each type of varnish has its own unique composition. To ensure that the product is firmly attached to a glossy surface, it also includes various active substances or nanoparti products which react with colours at the molecular level and are firmly attached to its surface. Due to its specific composition, the initial structure of the solution is liquid, but when it comes into contact with air, it changes and forms a thin thick film. Manufacturers add additional additives to the chemical formula of the product that affect the characteristics of the coating (moisture resistant, withstand high temperatures or resistant to minor mechanical damage). It should be noted that a substance with a similar chemical composition has only recently been used as a coating for cars, but has been used for quite some time in other areas. Liquid glass volume In such areas, in addition to polishing, liquid glass (with different variations in chemical composition) is also used for the car body in such areas:Engineering. In this industrial area, the substance is used for the production of livnica mixtures. The paper industry uses cellulose fluid. In construction, mortars are added to the acid-resistant concrete. The chemical industry. In this industry, the substance is used more widely. It is found in many detergents and detergents. It is also added to the color of the material that the aim is shine. In order for the substance to be used as varnish, its composition changes slightly. Elements that may adversely affect the upper layer of LCP are excluded from its formula. In this area of application there is no liquid glass in its pure form. It is so-called to identify among other car body care products. Functions of liquid glassThen the substance is designed to create a transparent film after drying that protects against contact of the treated surface with moisture and air. This property was particularly useful for metal products. With prolonged contact with moisture and oxygen in the air, an oxidative reaction occurs. It gradually destroys the metal, which can cause the car to quickly lose its output. Liquid glass is one of the cosmetics used for polishing cars. Classic polishes are most often based on wax. They are used to return the car to the former glow and freshness. Most classic cosmetics in this category have a short score - only a few washbasins, wax is washed out (the use of shampoo and cables destroys the film) and the body loses its protective layer. Because of this, the body should often be varnish. Liquid glass has a similar effect - it creates an invisible film on a treated surface. It eliminates stuffing, as the transparent composition fills all the micro scratches, and the car looks like a passenger coma. Compared to conventional polishing, it has a longer duration. By using it, the owner of the car will make his vehicle more present, regardless of its and class. Some manufacturers guarantee that the car will maintain its luster for two years. In fact, it all depends on the number of washbasins and how this procedure is performed (some do not wash the dust out of the machine, but immediately try to wipe it with a watered cloth). Nevertheless, the tool still has a long history of protection. Another feature of liquid glass is that the dust does not collect as much on this. Especially in summer this is observed when the car is in an open parking lot. It also protects the film from a minor mechanical impact, for example, when the car owner sweeps dust off the car or drives close to security. TOP 10 of Toyota's most beautiful modelsTho the protective layer would last longer, the car should be washed without the use of autochemical fabrics, brushes and cloths - just dust with water. The maximum effect is achieved only by observing polishing technology. In rainy weather, droplets of water are randomly slid from the car treated with auto-ceramics and do not need to be treated so that they do not form after drying the freckles. Cars are easier to wash because the dirt fits even worse in the glow. The color of the color gets brighter. Types of liquid glass Three types of glass are used for automotive polishing, which forms a durable film. They're based on Potassium. A characteristic of this base is its frilability, which makes the material able to absorb moisture. Sodium. In addition to low hygroscopicity, the material also has fiery properties. It will not save from fire, but protects layers of paint from infrared rays. Lithium. Such materials, such as car cosmetics, are used extremely rarely. They play the role of a temperature controller, so the main application is the manufacture of coatings for electrodes. The best option is sodium-based glass glass. More expensive products in their composition have different combinations of substrates, which cause certain characteristics of the product to change. Manufacturers TourV modern car cosmetics market is available a wide range of varnishes, called liquid glass. Among them are noteworthy mention, but you can often find a fake. Although such options are also liquid glass, the lack of experience in production affects

the quality of the products, so it is better to opt for those companies that have established themselves as quality products. The leading brands among manufacturers specialising in the production of quality liquid glass for cars are the following brands. Wilson is the first on the list since the chemists from this country were the first to develop this body polishing tool, so they have more experience than other brands. In the car cosmetics market, Wilson Silane products are more often found. If you want to evaluate the original from a fake, it's worth paying attention to: Cost. The original will cost more analogues of other production. The price can be compared with the information on the company's website. If a store sells goods at a hot price, then it's most likely a fake. The exception may be the sale associated with the liquidation of the trade. In this case, the cost of all categories of goods will decrease. Packaging. The company label (Wilson in red letters on a white background) is always printed on the original product box in several places. The Name Guard is always present in the name of the product. The whole set. In addition to the liquid bottle, the package must also contain microfiber, sponge, glove and instructions for use (in Japanese). Bull ZoneA South Korean does not sell any less quality products than the previous manufacturer. The bottle is equipped with a spray to facilitate the process of applying the liquid to the body. The tool can be used in several layers with a month interval. It creates a thicker film. The protective layer prevents the burning of the base layer of paint. The product is sold in containers 300 ml. Mothers Products of this American company are no less popular than a Japanese colleague. The product catalog contains many different products for the care of cosmetic cars. The use of different categories of polishing materials can give better results. For example, you can first use Micro-Polishing Frosting (also called frosting) and then Pure Brazilian Carnauba Wax (wax varnish). Some users even note the change in the colour of the car. SonaxO is another well-known brand specializing in the production of all kinds of car care products. The German manufacturer's goods, like the previous one, are not cheap. Compared to the varnish, this solution lasts longer on the surface, but in the opinion of some customers it is worse (than more expensive counterparts) to cover up scratches. In view of this, the scratched places should be polished with abrasive traps before the product is scratched. It describes how this procedure is to be implemented. Here. They most often try to for counterfeit Wilson Silane products because they are much more expensive than similar products. Much more often you can find fake German or American manufacturers. The products of the HKC Ceramic Coating of the Estonian manufacturer are classified as professional materials. Ceramic coating liquid is well distributed over the surface. According to the manufacturer, 50 millilitres is sufficient for two treatments. The film doesn't lose power to 80 sinks. Especially like the tool for some car owners with a touch of metallic paint. The car started to look original because of the creation of the prism effect. Soft99 Glass coating H-7/sheun's fabric, a single composition is broken down. Thanks to this, it can be saved for a long time. Suitable for working plastic, painting, metal and chromium parts. Narrow or wide tires: which is better? When using, avoid with rubber products. The components that do this can damage them. 50 ml should be sufficient for mid-size car polish. solution, although the instructions indicate the number 30. Ceramic Pro 9HThith tool falls into the Premium category. It's considered one of the most expensive polishes. It is practically impossible to find in shops, as it is only used in professional studios due to the high cost and complexity of the work. Experts do not recommend using this tool if there is no experience in treating the body with liquid glass. If the master even deviates slightly from the manufacturer's manual, it can spoil the painting. The effect of this product is durable foil up to 100 washbasins. Yes, 50ml. (volume of goods sold) is sufficient for only one treatment and then in three layers. Occasionally (at least 9 months) the upper ball should be refreshed to ensure that the coating does not lose its properties. How to set up liquid glass on the car? In addition to processing bodywork, car glass can be hinged on all elements of the machine that are susceptible to rapid pollution. For example, the product can be placed on the front bumper and windshield so that it crashed on them and dried flies easier to wash. Although processing the machine is not complicated, and you can do it yourself to feel the effect, you must strictly have to have to have to consistently have to do the technology specified by the manufacturer. Before you begin, you need to remember the basic rules. Basic rules for the use of liquid glassThe provisions are considered as basic and relate to the use of all varieties of water glass. These requirements include: processing must be carried out in a closed and well-ventilated area (not dusty), but in no case outside. At first, the product is sticky, so small residues (hair, pile, flue, dust, etc.) will leave an ugly mark. Before wearing the product, the machine must be dried and dried. The surface must also be revened. Do not use liquid at sub-zero temperatures. Boxing should be warmer +15 degrees, but humidity - no higher than 50 per cent. The body must be cool. Some mistakenly believe that liquid ceramics will fill all scratches and will not be visible. In practice, the opposite sometimes happens - the big mistake is not corrected, but it becomes more expressive. Given that the product masks smaller scratches and covers, the body should be polished with abrasive paste to eliminate problem areas. If a spray gun is used, the surface should be covered with a small layer, otherwise it can leave off and spoil the appearance of the coating. Some varnishes are prepared by mixing ingredients. In this case, you should be careful about the recommendations given in the package leaflet. As this is still a chemical agent, the worker must protect his skin, mucous membranes and respiratory with a reagent. What effect if the procedure is done correctly, the tool will repair the paint firmly. A transparent film will create a mirror effect on the processed surface. The car is getting new. In addition to auto aesthetics, this tool protects the body from the aggressive effects of certain reagents that are added to the sand for sanding the road in winter. Sometimes some companies use technical salt to save money, so every car needs such protection. Some bikers product not only relate to the body, but also to glass. Because the coating has a water-rems feature, small droplets do not exist on the windshield, but drain. Because of this effect, it is not necessary to turn on the patch to remove drops that distract from driving. If you try to remove them on an almost dry glass, then the sand that has fallen between the rubber janitor and the windshield can scratch the surface. Do not assume that the use of liquid glass will replace the dyeing of the contoured area. It's just a cosmetic product that only creates a protective film. Solutions do not contain dyes, so to eliminate toasted or scratched surfaces, a deeper treatment of the body should be used, which restores damaged layers of paint. How much does covering a car with liquid glass cost?ne little about the price of liquid glass polishing. When determining whether to process a car with this varnish, the first thing they think of the motorists is how much the car costs the glass. In fact, it's just one expense. Depending on the brand, the bottle will have to pay between \$35 and \$360. For a small car there is usually enough 50-70 millilitres (depending on the composition and fluidity of the material). If you're reworking a parquet SUV or minivan, then you should expect twice as much flow. In addition to liquid auto-glass, Need to do:the shampoo for washing the vehicle (price about 5 cu);clean if it has stubborn mutters (price no more than \$15);a fat-free sa paintworka (no more than 3 dollars);if the car is old, then it is necessary to give the dave crisps and deep ogreboine (abrasive polishing for the skin about \$45). As you can see, in some cases, to process the machine with liquid glass, you need to spend much more than pay for the tool itself. If the procedure is carried out by the masters in the salon, then you should expect them to take as much as material costs for the work. Self-re-entry liquid glass on the machineThen you decide to work alone, the beginner should choose half professional material in this regard. Firstly, compared to a professional colleague, the price of a size order will be cheaper. Secondly, it's easier to work with such tools. The next thing you need to pay attention to is the technique of the application. Each tool differs from others in composition and therefore works in technology. details of the procedure are given in the manufacturer's instructions. After preparing (points above a little) you need to take care of good lighting. This will allow you to properly polish the surface of the car and notice the defects. The next step is to close elements that will not be processed (windows, door handles, bicycles, lights). The previous film is then removed if the body has previously been treated with automatic glass. You can now start using the substance. The procedure itself is described in detail in the instructions, Does it have to be carried out in accordance with the following rule:re-ionation of the substance to the main elements of the tela, it is necessary to be subjected to a load after contact with a sticky substance (i.e. microfiber or sponge from fine porous foam rubber);p o apply the substance;dry the layer after 2-3 minutes (depending on the fine porous foam rubber);p o the application of the substance;dry after 2-3 minutes (depending on the fine porous foam rubber);p o the application of the substance;dry after 2-3 minutes (depending on the fine porous foam rubber);p o the application of the substance should dry after 2-3 minutes (depending on the fine porous foam rubber);p o apply the substance;dry after 2-3 minutes (depending on the fine porous foam rubber);p o the application of the substance;dry after 2-3 minutes (depending on the finely porous foam rubber);p o the application of the substance should be recommended by the manufacturer) the layer is polished with a soft nozzle on the medium speed grinder (in the budget version it is an electric drill with an appropriate number of drills). It is worth noting that polishing the body with liquid glass is a process that will take a long time. After wearing the first layer, let the car dry for six hours. The second thing must be assigned approximately 10 hours. The third layer should dry during the same period. After application, it is not recommended to leave the box so that the product dries and forms a powerful film. After 12 hours, you can drive freely. The only thing is that experts don't recommend a car sink for two weeks, and then they only use a pointless sink. Liquid glass for cars: disadvantages and advantagesSome car care product has its advantages and disadvantages, so every motorist has to figure out for themselves what he is willing to compromise about. The advantages of car processing in this category of car care products include:a durable film that protects against moisture and ultraviolet exposure;the product restores shine, The image on the new car, u some case, make the buoy of the vehicle saturated;the staklopom is given paintwork;dust accumulates less after application on the machine (some products have antistatic effects);the protective layer does not wash much of the spray from the application of the cameo;after crystallization, it does not fear the temperature change;protects metal elements and paints from aggressive reagents used for sanding roads in winter During the disadvantages of autochemicals are the following: rapid crystallization of the substance makes it quite difficult for the beginner to do independent high-quality body treatment;if the shortcomings of conventional polishing can be addressed immediately, then not forgive. You have to wait a long time for the layer to develop your life, or to remove the film and repeat everything again, which will fly in quite a penny; Compared to the corded and silicone varnishes, Autoglass is irritating;the upper layer should be periodically updated how the eyelid protection should be extended. but this is an additional waste;it is necessary to bring in almost ideal conditions - you need to look at the appropriate garage;although the protective layer is heat resistant, this is sensitive to the rapid shifts of temperature and can make the crete of the cold. If winters in the region are severe, then it is better to use other types of varnish;low ductility. In contrast to color and varnish, hard glass forms crisps during the deformation of the metal. A similar problem can occur as a result of hitting a stone into the car's body. In summary, it should be noted that this tool will be useful for those who aspire to bring in the ideal way to bring the shine of their car. These funds do not fall within the category of mandatory materials that a motorcyclist should use. Instead, liquid glass is one of many car care products. Depending on this, each car owner determines for themselves how to take care of their vehicle. Vehicle.
