With the rise in temperatures around the world, it has become common in many households with many people choosing it as their preferred method of temperature control in the summer. Unfortunately, the air conditioner has some maintenance that goes along with it and you have to keep it in the best possible condition to make it work smoothly and efficiently. While air conditioning has many parts, AC coils are essential for the cooling process and need to be cleaned and maintained effectively. AC coils are divided into 2 different types. Evaporator coil is the main part responsible for giving you cool air. Air also passes through the capacitor coil, which is the second part of the cooling process. Despite what many people believe, air conditioning does not cool the air. In fact, it just removes heat from the air. The evaporator coil extracts heat as it passes, and then, using refrigerant, allows you to have cold air. Heat is extracted and released outdoors while your home is kept cooler. The fan that is included on top will blow hot air through the capacitor coil, and it releases some heat from the refrigerant before it is passed outdoors. These two coils must remain in optimal condition for your air conditioner to have an efficient cooling process. Operating an AC unit with dirty coilsOne of the biggest mistakes you could make is using an AC unit with dirty coils. One of the first problems you will have is the lack of cooling in the home and the coils will not be able to effectively extract all the heat. The only way to have air conditioning work efficiently is to make sure coils are kept clean and free of contaminants. Impurities or contaminants will eventually act as a barrier for coils, from leakage. This could also lead to drainage problems, but fortunately it can be fixed quite easily. After thoroughly cleaning the scrolls, your AC unit will work as if it were brand new. Cleaning should be carried out frequently to ensure that dirt does not bother. The characteristics of a good COIL cleaner, when looking for a good AC coil cleaner, there are a few things to keep in mind. With so many options available, it can be a daunting prospect to find the right one. Here are a few things you should look for in a large coil cleaner: Alkaline based: Acid-based products are commonly found in many cleaning products. The acid will clean the coils, but the impurities on the coils may be somewhat stubborn and the acid could damage the coils. Most AC manufacturers recommend using only water, but a fine alkaline substance can also work. Usability: The product should be easy to use and you should not have to make too much effort. If an additional sprayer is included, the application process will be much easier and you do not have to worry about the application too much. USDA Authorized: If the U.S.D.A. product is authorized, it means that it will be safe for use near food. This also means that you do not have to worry about any poisonous substances that could cause problems for your health. Price: Some cleaning products specially designed for cleaning AC coils may be more expensive than the versatile cleaning products you are used to. Fortunately, a little can go a long way. Versatility: While you can only use this cleaner once in a while for your coils, you should look for something that can be used elsewhere. This gives you more versatility and makes it that much easier for you to use the product to remove dirt and dirt elsewhere. No harmful ingredients: Chlorinated solvents are quite harmful to the environment, and while they do the cleaning work a little faster and better, it doesn't bode well for your health. While it may be hard to find something completely green, you should consider something ozone-friendly. When it comes to cleaning substances, it can be hard to specifically say that some ingredients are better than others. One of the main things to keep in mind is safety. You should check the labels for safety information and whether the product can be harmful to your health as well. Is this a DIY job? Cleaning the capacitor and evaporator is a job that you can do yourself, but requires great care. Be careful not to bend the fins of the coils or not to break, move or bend any of the pipes. Of course, it is always important to turn off the air conditioner first to avoid the risk of electric shock! However, if you are not satisfied with this or are worried about damaging your system, make an appointment with an HVAC supplier. It would be great to get a maintenance contractor this service too!
