How to recover deleted tweets 2017

By Faizah Imani You have a web page that you accidentally deleted and need to get it back? You may be creating a new website and would like to go back to the pages of your old website to get some ideas for your new one. Whatever the reason, you have a great chance of getting your web page back. Collect all information relating to your website, such as your domain name, as well as information for the administrative contact who is above the website administration. Contact the company hosting your website. Show it with your domain and administrative contact information. Advise the company that you deleted the web page and would like to recover the deleted file. Most web hosting companies back up all their website pages. The company will be able to find the file you deleted on the backup server and restore it to the file directory. It is best to contact your web hosting company as soon as possible after deleting the web page to increase your chances of recovering the page. Use the Wayback Machine internet archive to find a deleted web page if you don't want to go through a web hosting company. When you go to the Internet Archive Wayback Machine, you can enter a domain name for your website. Wayback Machine's online archive will then pull up all the pages of the website that have been linked to the website, no matter how old they are. It's great if you would like to go back and see a web page that was deleted years or months ago. Click on the page of your site that you would like to restore via the Online Archive Wayback Machine. Click on the option View in the menu bar of your internet browser. Click Page Source. Copy all HTML encodings associated with the deleted webpage from the page source. Paste the copied HTML from the page source into your website's HTML editor. Save your work. You should now be able to browse the web. Some of the graphics may no longer be in place, but all the text aspects of the web page should still be in. You will have to download the new graphics. Photo: David Murphy Computer eded my term paper! We were all there. You delete an important file (perhaps even accidentally deleting it (in Windows) or forgetting it until a second after you clean the recycle bin or recycle bin. like a few clicks. Part 1: OverviewScreenshot: David Murphy (Backblaze)Before switching to full file recovery mode, take a second to double check the folder you saved the file to, also the Recycle Bin or Also, think about settings: Do you have backups stored elsewhere? Is there an app like OneDrive, iCloud, Backblaze or Google Backup and Sync automatically saving everything you do in the cloud? If so, you'll be able to restore a recent (or slightly older) version of the file from there instead of going through more complicated steps. Otherwise, you need to contact the File Recovery Program to help.1. Stop what you do, When your operating system deletes a file, all it really does is mark the hard disk space that your file occupies as free space. It still exists, but your computer is now absolutely happy to write new data on top of it – at which point the process of recovering files becomes much more complicated. This means you should do as few calculations as possible until you find the file you are looking for as your chances of recovering the file have come down every time your computer writes information to drive.2. Find the right file recovery program Screenshot: RecuvaWindows: You have many great open source options and free file recovery software if you're using Windows. We are big fans of Recuva, which has both free and professional versions, but you should also consider easeus data recovery wizard (2GB limit for free version) and PhotoRec. Between these three programs the odds are good, you will be able to save everything you have removed and, yes, you want to try different programs if you do not find what you have uninstalled. Don't give up! Mac: You can also get a free version of easeus data recovery wizard for Mac – the same 2GB limit as before if you don't pay. PhotoRec is also available for Mac, as is testDisk's open source tool. You can also try Disk Drill, although I believe it should be running before you delete the file (for the free version at least).3. To restore the files to which you selected the tool, it is time to scan your hard disk for a lost file or files. This process depends on the program you're using, but it's very similar to all of them: just point the app to the hard drive or folder that held the missing file and start scanning. When the scan is complete, you'll see a large list of file names. Often most of these files are nothing more than the system files that your operating system created during the main job, and you won't need to worry about them. You're just looking for a file type and a name that matches what you've lost. Once you've found what you're looking for, select it and select an option to restore it, however you do so in each individual app. As mentioned, if you haven't found anything in one program, try another one—and another. Don't give up until you've exhausted a few because you may be able to extract success from failures if you are persistent. Part 2: More specific specific you received a basic overview to recover deleted files from your computer. We will now carefully look at some more specific problems, data recovery techniques and tools that can help in your pursuit of your elusive lost data. Recover files from a wiped or unloaded hard drive So you don't just accidentally delete a file or two and prematurely empty the recycle bin, instead you're dealing with an entire hard drive that costs the missing data. First, you want to stop using the disk as we mentioned earlier. If your system's primary drive has

gone kaput, stop trying to boot up your computer. Remove the disc from your laptop or desktop (if you can), slam it into an external case, and use another computer to try to recover its precious contents. Many of the apps we mentioned before should work just fine for your damaged or deleted drive. Screenshot: GParted (Live CD)If you can't delete a disc or don't have other computers that you can use (or borrow) to help, try using something like Active@ LiveCD, any other Live CD that comes with TestDisk Recovery Tool. You will boot to one of them rather than the main hard drive and you will hopefully be able to recover your files that way. (It's all said, it's a perfect example of why it's critical for you to back up important files elsewhere - ideally the cloud, so all you lose in hard drive crashes is the time it takes you to buy a new one, reinstall windows, reinstall your apps and re-download your critical stuff.) Recovering lost photosScreenshot: PhotoRecIf you need to resurrect photos from a damaged flash memory card from a digital camera, you'll be glad to know that most of the apps listed in part one above will do the trick - you just need to plug the camera or insert a card into your computer's card reader before you run the data recovery program of your choice. (I would try PhotoRec first and then other programs as needed.) Assuming you haven't lost files due to some strange mechanical problems, your best choice is to stay safe going forward to make sure you import photos once you plug in the camera (or card reader). You can set this up directly in Windows or macOS, and there are plenty of other apps like Dropbox or Google Backup and Sync that will be more than happy to send files to the (safer) cloud at the time the device is connected. Recover lost Word documentsIf a lost dissertation is saved as a Word document, you have some more interesting options for getting lost or deleted documents. Acronis has a great tutorial on basic Word allows you to recover what you accidentally delete (or lost) like Microsoft itself – absolutely worth reading before you start to panic. And as James Grasshoe points out in Cloudwards: You can try hunting for files with asd asd Too. These are temporary files that Word uses to store your work while you are working, but before saving. If you can find them, Word should be able to open and recover at least some of the lost data. Do you want to recover data from scratched CDs People still use CDs and DVDs? In case you're in the minority - you still have access to an optical drive (built-in or external) on your computer - you have several options for recovering data on scratched, old or other problematic CDs and DVDs. First, however, resist the urge to wipe them with a banana. Yes, people do it. If you're trying to extract data from an audio CD, try the free Exact Audio Copy app. If it doesn't give you results on optical drive, try the same CD and app on another optical drive - most likely the second, since I doubt you have multiple drives sitting around. Otherwise you can try the Live CD route again, and boot into something like SystemRescueCD (on a flash drive) and use its built-in ddrescue tool to extract everything you can from your scratched media. While currently almost a decade old, a number of people also swear by the invincible Copier Roadkil as a great app for resetting the contents of your scratched disc. If that doesn't work and you can't select options, you can always try polishing the disc as best you can to see if it solves the problem. A number of people have come up with different methods of resuscitating your scratched disk:Part 3: Don't let this happen againWhether it happens, what is the cause of your lost file, the best method of data recovery is a good preemptive data backup plan. If you're using Windows, you have plenty of options for making multiple copies of your critical data, ensuring that accidental deletion is more of a nuisance than a disaster going forward: We're scratching our collective heads as to how the October 10 Windows update ever went... Lifehack managing editor Virginia Smith... Learn moreWhether you don't decide, make sure you choose something to keep your data safely replicated elsewhere. I always recommend a three-year approach: Keep a physical backup that you can access as a separate drive or external storage device, even if you update its contents sparingly (once a month, say). Use some cloud backup tool or service - many free and cheaper options available - to also store more critical files, even if you don't update them regularly. Finally, pay for some backup service that syncs your work with the cloud, so even a quick oopsie (or shift-delete) will cost you only a few minutes to restore the file, not the hours you otherwise spent updating your document or presentation.
