Karl Fulves. Numbers pervade nearly every aspect of our daily lives: telephone numbers, zip codes, Social Security Self-Working Number Magic: 101 Foolproof Tricks, driver's license and credit-card numbers. We are beleaguered by numbers: no wonder we're fascinated, intrigued, even a bit bewildered by them; no wonder tricks involving numbers are perennial favorites. With Self-Working Number Magic you can perform show-stopping tricks, stunts and routines that are sure to delight audiences because they capitalize on our natural fascination for numbers.

Karl Fulves, well-known writer in the field of magic presents baffling tricks that are so easy to do they Self-Working Number Magic: 101 Foolproof Tricks work by themselves. While all the tricks involve basic mathematical principles, the mathematics is not discussed here; rather, emphasis is on performing and perfecting the tricks. They can be learned quickly and put into operation immediately, and best of all, they really dazzle an audience.

Among the seemingly impossible tricks and stunts in this book: guessing a spectator's age or how long a married couple have known each other; predicting the sum of a group of numbers and using your brain like a lightning calculator; and instantly memorizing long lists of numbers or things.

This selection also includes tricks involving cards, calendars, magic squares, and betting games. The author even suggests stage patter to use while performing. With this book and a modicum of practice, anyone can perform an assortment of number tricks that will astound and delight an audience.

Whatever your age or math skills, you'll soon be baffling friends and relatives with over fascinating, foolproof tricks. For over 40 years, he has written hundreds Self-Working Number Magic: 101 Foolproof Tricks books on the subject and taught the art of illusion to thousands of people of all ages. This legendary figure also edited and published such magazines as Epilogue and The Pallbearers Review.

Self-Working Number Magic: Foolproof Tricks

By Karl Fulves. The tricks, stunts, and games described in this chapter provide clear plot ideas to the spectator. But although they are seemingly simple in effect, they lead to surprising Self-Working Number Magic: 101 Foolproof Tricks. Although based on established principles, they are generally not well known, even to magicians, so they are likely to fool even the most sophisticated spectator. Follow it with a trick like Stunumbers in the next chapter and you will have an exceptional combination.

I just found something I had written in grade school, the magician says. He holds up the piece of paper shown in Figure 1. Written on it in Self-Working Number Magic: 101 Foolproof Tricks is nine. The magician continues, I remember it clearly.

We were asked to write our age on a piece of paper. I wrote this number and handed in the paper. He says, This was when I performed my first magic trick. I wrote a dot like this, then I erased it by magic. The magician rubs the paper and the dot mysteriously vanishes. Picking up the nine paper, he turns it over. Now there is a dot over the i, as shown in Figure 2. The secret is shown in Figure 3.

The number nine is written in script in such a manner that it reads the same right side up or upside down. The dot is placed as shown. When you hold the paper as in Figure 1 to display it, the right thumb covers the dot. Place the paper writing-side down on the table. Then pick up another piece of paper and pretend to draw a dot or circle. The spectators hear you write, but what they hear is the sound of the fingernail scraping against the paper.

Place the pencil aside. Pretend to cover the dot with the fingers. Rub the fingers back and forth. The dot seems to have vanished. Then pick up the nine paper, but make sure it is turned around so that the dot is uppermost.

Now the number appears as shown in Figure 2. The Self-Working Number Magic: 101 Foolproof Tricks has been magically transferred from one piece of paper to Self-Working Number Magic: 101 Foolproof Tricks.

Some computer dating systems use astrology and numerology to bring compatible people together. When you meet a happily married couple, offer to demonstrate how numerology applies to computer matching. The husband and wife sit across the table from one another. Give each a piece of paper. Ask each to jot down a single-digit number, that is, any number from 1 to 9. Ask her to do the computer figuring as follows. She is to double her number, add 2, multiply the result by 5, and subtract 3.

Naturally the computer would do this instantly. Self-Working Number Magic: 101 Foolproof Tricks computer would have your number on file, the magician says to the wife.

And after doing that bit of figuring it would look for a compatible number in its memory bank. What result did you get? She might say You can see how well it works. You must be very compatible because you wrote a 2 and your husband wrote a 7.

And they did! Whatever digit he chose, subtract it from In this example he wrote 7. Subtract it from 10 to get 3. In this case 3 is the key number. Have the wife double her number, add 2, and multiply the result by 5.

Then you have her subtract the key number, which in our example is 3. When she does, she will get back both of the original numbers. To take the above example, she might write 2 and her husband 7. She would double 2 to get 4, add Self-Working Number Magic: 101 Foolproof Tricks to get 6, multiply the result by 5 to get 30, and subtract the key number 3 to get It is not necessary to make it obvious that you know his number.

You can glimpse it and then turn away. All that is required is a quick glimpse of the number for the work to be done. As simple as this trick is, it has a strong effect.

The happy couple will be delighted to discover that the computer verified their compatibility and they will be mystified as to how the computer knew. Some numbers refuse to be added, the magician says. The spectator is handed a pad and pencil. He writes the number 81, but he does so with the writing side of the pad away from him as shown in Figure 4. The pad is then given to someone else, who totals the numbers and arrives at the sum of The reason why is even more puzzling than the mysterious sum of 28 because the spectator discovers that although he definitely wrote 81, that is not what appears on the pad!

When the spectator holds the pad as shown and writes the number 81 on the reverse side, the writing reverses itself, changing 81 to You have only to try it once to convince yourself that it works. To present the trick, draw a scribble on the pad, saying that it represents a mysterious method of hypnotizing people into doing strange arithmetic.

Take the pad from him and under his number write the number Draw a line below the two numbers and have someone total them. The first spectator will want to check the addition, but when he sees the writing he will be surprised to discover that his numbers have rearranged themselves. The hypnotic spell worked. You offer the spectator an engagingly easy way to make a quick dollar.

Deal 16 slips of paper or business cards in a row on the table. The slips are writing-side down so no one can see the writing. Tell the spectator to jot down the numbers 1, 2, 4, 8 on a pad in any order and to put plus and minus signs between the digits. He can use all plus signs or all minus signs or any combination of plus and minus signs. He might write the numbers like this: Remember that all this is explained beforehand so you cannot back out or change the rules.

In the above example he would perform the indicated addition and subtraction operations and arrive at Self-Working Number Magic: 101 Foolproof Tricks total of The result is then automatic. You cannot lose because he must end up on an odd-numbered slip. If, for example, he arranges the slips in the order 2, 4, 1, 8, and puts in plus and minus signs as follows:

As mentioned, he disregards the minus sign in the answer. He will thus arrive at the slip in the third position from the left and he loses. You can cause the sum to be an even number by noting that the controlling factor is the digit 1. If you use just the digits 2, 4, 8, in any order, with any combination of plus and minus signs between them, Self-Working Number Magic: 101 Foolproof Tricks spectator must arrive at an even number.

To exploit this, write the numbers 1, 2, 4, 8, 16 on separate business cards or blank squares of cardboard. Lightly mark the back of the 1-card so you can recognize it at a glance. The top slip of the packet is an I Owe You slip. Hand the spectator Self-Working Number Magic: 101 Foolproof Tricks packet of five business cards.

Tell him to mix them writing-side down and choose any three or four cards. Self-Working Number Magic: 101 Foolproof Tricks note whether or not he picks the 1-card. If he does, deal the 16 slips of paper from right to left. Note that the real work is done before the game begins.

Have him arrange the chosen business cards in any order. Then tell him to place any combination of plus and minus signs between the numbers and carry out the arithmetic operations. Whatever the result, he counts to that number, beginning at the left. This point should be made clear to the spectator at the start. You can simplify things by standing at the same side of the table as the spectator.

Sep 05, Alan rated it really liked it Shelves: magic. There are so many simple number illusions that there is no need to include some of the illusions he has. Although Karls breadth of choice does give an idea of the options available to anyone who want to move forward, so maybe I am not being fair.

Jun 02, King Luma rated it liked it. I've only read a bit of the book so far, but I've learned a couple of good tricks from it. I'm thinking of using some of the tricks in the book as the basis for an animated video.
