tank model kits - all the model kits at hobbies

However, recent trends in which kits contain over 1, individual pieces including parts from plastic, etched brass, and aluminum have given new meaning to the 'out of the box' build. Today, a stock kit can be very highly detailed. Customized kits are typically built by more experienced modelers who take a kit and add components, either scratchbuilt or commercial conversion or aftermarket accessories.

Such models may be more highly detailed than a straight build 'out of the box' though the trend to more detailed kits is decreasing the difference. The term 'kitbashing' denotes models built using parts from more than one kit to make a single, more accurate or different model. Many armor

modelers engage in the use of aftermarket sets and built from scratch scratchbuilt parts to make their models more accurate or simply unique. In extreme, master-level cases, a model with hundreds of kit components may be detailed with several hundred additional commercial and home-fabricated parts to reach a very high level of realism. Scratchbuilt models are those for which no kit exists; highly skilled modelers create their vehicle from sheet plastic and components they fabricate themselves.

Some scratchbuilt models may contain a few commercial components, but typically it is a small proportion of all the model's parts. Scratchbuilt models may also be made from brass and aluminum, cast in pewter a low temp metal and cast with 2-part resins in molds made of RTV rubber material. The media used by aftermarket companies range from turned aluminum and brass, photo-etched steel or brass sheets, pre-bent brass wire, cast metals, and resin. Aftermarket markings are also available. Firms such as Archer Dry Transfers or Decalomaniacs produce stand-alone sheets of wet or dry transfer markings to allow the modeler to complete a different or more accurate variant.

Enthusiasts may pursue military vehicle modeling in its own right or as an adjunct to other military modeling. There is also some crossover with wargaming, diorama building, and re-enacting. Many models are displayed with no base or other setting. Their wheels or track rest upon the shelf or table on which they are displayed. This display method is the easiest and cheapest, but has the disadvantage that the fragile model may be damaged when handled. A simple wooden base adds an element of protection to the model because the model itself does not need to be handled, it can be moved by handling the base.

Bases may also hold a plate with some information about the model, such as its title or designation, or some historical background. This kind of bases typically consist of a frame of wood or other material. Finishes on bases range from painted plastic to stained wood to simple landscaping. The disadvantage is that the base adds expense and time to the project. A diorama is a more elaborate base with landscaping to provide a setting for the model, and often includes a story with figures. Dioramas have the same advantages and disadvantages of plain bases, but to a greater degree. Models are often displayed in competition such as the AMPS annual show, or in club displays at hobby shops and other events. Several organizations and publications exist to support and promote the hobby of modeling military vehicles.

Model Tanks - Complete Your Army Collection with a Model Kit Tank

Major tank engagements early on convinced governments on all sides of the need for more survivable and deadlier vehicles. This means that there is a large variety of different subjects which were designed to fulfil different roles under different doctrines. Any vehicle serving in a setting after is considered "modern. Models may also be categorized by place of service, for example, US or Soviet. They may also be categorized by function, for example, combat engineering vehicles, recovery vehicles, etc. In all cases, the national and unit markings on the replica determine the era and user nationality. Models are generally built with historical accuracy in mind, and each model may represent many hours of research effort on the part of the modeler. Frequently, modelers display some of their research work alongside their model. There is generally some crossover of modelers between the eras, though some focus solely on a specific era, country of origin or operation, or even on a specific vehicle and its variants.

Models are usually assembled from commercial kits for exceptions see below. Typically, a model kit consists of a set of parts, instructions for their assembly, and a small sheet of markings in decal form. Parts are produced by injection of liquid styrene plastic under very high pressure into complex steel molds. These molds are generally composed of two-halves that sandwich the parts; however, 'slide molds' may consist of many steel components to allow greater levels of detail to be incorporated into a single sprue. Once the plastic cools, it is removed from the mold. In the s and s, typical vehicle kits might contain 50 to individual parts. Today it is common for a single vehicle kit to contain from to parts.

Each part must be carefully cut from the 'sprue' the plastic channels that allow the plastic to flow into the mold and which hold the parts in place, cleaned of any flaws or mold marks, and then assembled. Instructions consist of paper booklets or sheets supplied with each kit. Usually, instructions show drawings of the parts. A recent trend has been the use of photographs rather than drawings, but these types of instructions have not proven popular and may be declining in use. For a kit with hundreds of parts, good instructions are vital. Flaws in instructions are not uncommon. Markings for the model usually are provided as decals. The focus of many manufacturers of late has been to increase the accuracy of their kits and provide alternative types of material such as photo etch details and turned metal barrels. Completed models can be categorized generally into three classes: kits built 'out of the box', customized kits, and scratchbuilt models.

Models built 'out of the box' are built according to kit instructions, using no materials except those provided in the kit itself. In the past, there was some tendency to view 'out of the box' builds as simpler or of a lower standard of detail than modified kits see below. However, recent trends in which kits contain over 1, individual pieces including parts from plastic, etched brass, and aluminum have given new meaning to the 'out of the box' build. Today, a stock kit can be very highly detailed. Customized kits are typically built by more experienced modelers who take a kit and add components, either scratchbuilt or commercial conversion or aftermarket accessories. Information Resources Terms Site map. This is because the scale helps to evaluate the dimension of the scale model based on that of the original object. To calculate, simply multiply the size of the actual object by the scale. For example, if the object is 5 meters long, the model will measure As for the corresponding figurines, they are almost 5 centimeters high.

With military models, you have the opportunity to reproduce the great battles of history. It is possible to refine the selection according to the type of model sought. It is possible to build your own diorama in order to reconstruct a frozen image of a historical event or an emblematic device of the great wars. In addition, there are a large number of accessories from miniature battlefield scenery and war dioramas to make your creation even more realistic. Here is a selection of the most appreciated products for a military model diorama. Several parts of the model are pre-assembled in the box. Apart from the parts to be cut and assembled, it is necessary to equip one's a little material such as model glue, cutting pliers and paint. If a model is not listed on our site, the chances are it is not available for sale. However, we do offer a service to build and paint the model. We have limited capacity to offer this service — if you are interested, please contact us at sales armortek.

This service cannot be ordered through our website. Our kits tend to be produced in batches of limited numbers — typically less than kits — hence they are Limited Edition. Historically Limited Edition runs of the same model have been run between 3 to 8 years apart, with some models having had no re-run to date. Unfortunately not.
